[before you flame, look through the programming manuals via the GX Fan Club GXDev page listed below]

GX was designed to be a PMT-able graphics API. It is an object-based, vector-based graphics library with very robust features. It was designed from scratch with desktop publishing for 2-byte languages in mind. It was designed from scratch to be a cross-platform library (at Comdex, Apple demoed a Netscape plug-in that displays GX graphics under Windows 95). With GX, all graphical objects are called shapes. Shapes can be collected in larger groups called pictures. All operations available for shapes are available for pictures. Even text is considred a kind of shape, and all shapes can be used for masking and other special effects purposes.

Proposal:

A number of us have noted these useful qualities of GX and have decided to try to design a next-generation GUI for the Macintosh based on QuickDraw GX. Due to the object-based nature of GX graphics, GX GUI elements would be remarkably powerful:

*Any GX graphical objects or set of objects can be transformed using a 3x3 transformation matrix.

*Transparency and coloring issues are resolved using powerful attributes found in "ink objects."

*In-place editing of text that follows an arbitrary curve (rotated/skewed/etc is optional) is only two or three steps of complexity beyond the standard "Hello World" program when using GX calls.

*Transforming a GUI element from one type to another would be trivial using the GX library since any shape object can store arbitrary data in "Tags," which could be used to store GUI-specific data.

*Menus could become docking stations for any arbitrary GUI element, including another menu, merely by using the already existing GX API.

*WIndows could be skewed or rotated or given a 3D perspective and rotated *into* the screen or merely scaled [allowing full view of 2 or more windows' contents as they are updated] using a simple 3x3 transform matrix.

*OS language localization issues are relatively trivial because the GX font model was designed from scratch to handle single and double-byte languages desktop publishing issues.

*Because GX was designed with PMT in mind, the issues that Apple faces to implement GX with full pre-emption are likely to be far less costly and time-consuming than any other options available for them to create the next-generation MacOS GUI.

*Because GX is available already, a "shell" could be created to allow Macintosh developers to share a common code base between the current System 7 and the not-yet-released MacOS 8. THis would provide a MUCH larger customer base than would be available according to current rumors of an entirely new API with no backwards compatibility.

*An Windows Manager and GUI API based on GX could be designed to be as robust and simple to use as the Mac's user interface itself.

*Because GX was designed to be cross-platform, in theory a GX-based GUI could be ported to any platform, including the Internet.

The discussion of how to implement a GX-based GUI and Windowing system is taking place primarily on two mailing lists: GX Dev and AIMED-talk. Subscription info can be found in my sig.

Anyone interested in discussing issues related to implementing a GUI and Windowing system based on the most powerful 2D graphics library available on any platform

[yes, I know about Display PostScript]

should consider monitoring and contributing to these discussions on the

AIMED-talk and GX Dev mailing lists. We believe that a GX-based GUI is viable and the best solution for Apple's immediate OS problem. Apple engineers are known to be monitoring this discussion, so it is conceivable that the ideas generated may actually be used in the next-generation Mac OS. At the least, the discussion should generate some interesting ideas concerning cutting edge user interfaces and PMT-aware windowing systems when using vector-based, object-based graphics.

I don't read most of the newsgroups that I'm posting this to, so any feedback/questions/flames will have to be sent via e-mail.

Thanks for your time.

This is something I've been thinking of for a long time (approx. 2.5 years)
and I never quite seen to get down to it. A thought for you all: I've seen a
program which (by judicious use of nobbling Trap #2, I think) disabled the
zoomboxes and speeded up the desktop by some small amount. Could the same not
be done in reverse, so to speak, by installing a routine which draws,
basically, a prettier zoombox? What I had in mind was, admittedly, grabbing
a chunk of screen bitmap (vro_cpy...etc) and kicking it until it looked like it
was texture-mapped over a spinning box, but I suspect wireframes may be both
easier and quicker. Thoughts?

Follwup - tried it, GST C didn't like it (and I can't see any reason why
not). Wrote a similar routine in HighSoft BASIC, which appears to work, but
doesn't actually /do/ anything. Should I switch to supervisor mode before
accessing the GI chip?

You'll need at least a 68030 CPU and 8 MB RAM at least to run X-Window
properly. LiNUX requires built-in MMU, which only 68030, 040 and 060
has.

> Don't need to. I use Geneva most of the time which gives me unlimited
> slots. Still only use four or five though!

Using a multitasking system really makes .ACC's irrelevant. Just start
everything you need to run as applications and bingo! :-)

I normally run 8 applications in the background (GemView, ST-Guide, LZH-Shell
etc.etc.), so that they're always ready for use when I double-click on a - say
.LZH-file it gets piped to the LZH-Shell via the AV-protocol. The memory doesn't
get so fragmented either when programs are run as applications instead of ACC's.

Keep Cool and Flying...

Yeah. Why should people pay you money for a few sheets of printed
information that is easily available at Hyperreal/Harmony-Central?

Anyone want to send me money for details on how to wire audio cables?

Anthony.

THERE'S STILL TIME TO GET ATARI STUFF IN TIME FOR CHRISTMAS!!

Our unique selection of Atari hardware and software (Lynx, Jaguar, and
ST!) is the perfect gift for the Atari fan on your Christmas list, and
if
you're the Atari fan, giving hints to the ones you love is certainly
encouraged!!

Here's a list of some of this year's hottest sellers:

LYNX GAMES

Games List & Prices as of Dec 11, 1996

A. P. B.	$19.95	NFL Football	$39.95
Awesome Golf	$29.95	Ninja Gaiden	$29.95
Basketbrawl	$19.95	Pacland	$19.95
Baseball Heroes	$19.95	Paperboy	$39.95
Batman Returns	$19.95	Pinball Jam	$19.95
Battle Wheels	$39.95	Pit Fighter	$19.95
Battlezone 2000	$39.95	Power Factor	$19.95
Bill & Ted's Ex. Adventure	$19.95	QIX	$19.95
Blockout	$19.95	Rampage	$19.95
Blue Lightning	$19.95	Rampart	$19.95
Bubble Trouble	$39.95	RoadBlaster	$39.95
California Games	$39.95	Robosquash	$19.95
Checkered Flag	$39.95	Robotron 2084	$19.95
Chip's Challenge	$19.95	Rygar	$19.95
Crystal Mines II	$19.95	Scrapyard Dog	$19.95
Desert Strike	$39.95	Shadow of the Beast	$19.95

Dinolympics	$19.95	Shanghai	$19.95

NEW JAGUAR TITLES NOW AVAILABLE!
==========

Now available for the Atari Jaguar are TOWERS II and BREAKOUT 2000!

Vince Valenti's ST hit TOWERS II is now available for the Jaguar for just
$59.95! Available now!!

The all-time arcade classic makes its way onto the Atari Jaguar! Just $59.95!

Also, buy an Atari Jaguar system with Wolfenstein 3D for just $59.95!!! It's a FANTASTIC DEAL! Order TOADAY! FULL SELECTION OF OTHER JAGUAR TITLES

AVAILABLE TOO, WITH SPECIAL PRICES GOOD THROUGH 12/23!!

AMAZINGLY HOT ST STUFF -- PRICES GOOD THROUGH 12/23/96!

This holiday, give the gift of TRUE MULTITASKING with MagiC 5, just $99.00! Or, give what everyone's after, TRUETYPE FONT MANAGEMENT and VDI ACCELERATION with NVDI 4!

MAGIC PC SPECIAL! THROUGH 12/23!!
Get MagiC PC for Windows 95 and run ST programs on your PC -- FAST! It's just $169.95 -- NORMALLY $189.95 -- through 12/23!! Order TOADAY!

MAGICMAC SPECIAL! THROUGH 12/23!!
Why pay more for MagiCMac, the premier ST emulation software for the Mac!
Through 12/23 pay just $169.95 -- NORMALLY $219.00!! SAVE $50.00!! Works on Power PC and 680x0 machines! Also, get POWER PRINT for Macintosh (use any parallel printer on the Mac or with MagicMac) for just $189.00!!

IMAGECOPY 4.0CD!! JUST $49.95!!
The premier image conversion & printing program for the ST/Falcon is still
available! Also available is the ImageCopy 4.0CD upgrade for just $15.00!!

PAGESTREAM!! JUST $39.95!
PageStream, the best, valuepacked page layout & design program for the ST
is just $39.95!! ORDER YOURS TOADAY!

C-LAB FALCON SPECIAL!! THROUGH 12/23!! PRICES SO LOW, WE CAN'T PRINT THEM!
We've got C-LAB Falcon MK-X, MK-I, and MK-II machines, in 4 and 16MB configurations! If you're interested in getting a quote, please call Jennifer at (410) 544-6943! Available with and without Cubase Audio!!

C-LAB FALCON MK-X UPGRADE KITS! JUST $299!! SAVE $100!
Upgrade your Atari or C-LAB Falcon to the Falcon MK-X expandable, sleek black case for just $299! Available through 12/23 for $100 off the regular
$399 price!

ATARI HARD DISK SPECIAL!! FANTASTIC CHRISTMAS OFFER!
OUT OF THE TOAD VAULTS AND INTO YOUR HOME come these fantastic deals on these VERY CUTE, very SMALL hard disk drives for your Atari ST/TT/Falcon.
They are small, portable SCSI drives available for a LIMITED TIME ONLY! BUY NOW AND SAVE! Based on 2.5" SCSI drive mechanisms, they are fast and very reliable!

40mb.....$ 79.00
80mb.....$ 99.00
120mb.....$109.00
160mb.....$129.00
530mb.....$249.00
ICD Link II.....$ 99.00

ATARI SM147 MONITORS -- WHERE ELSE CAN YOU GET THEM?
We still have Atari SM147 14" monochrome monitors available for $199 --- all available in time for Christmas delivery. Nothing else comes close!! Great for musicians! 14" display size makes a great upgrade from the SM124! But if you want the SM124, we still have refurbished models for $99
each!

ATARI TTM195 MONITORS -- WE HAVE THEM!
If you need 19" black-and-white clarity on your Atari TT030, there's no substitute for the ATARI TTM195. We have them NEW for $250(!) and a used model for $150(!!) Get yours while they last!! Only a small quantity remaining!

ATARI STACY COMPUTERS!!
If you're looking for the portable power of the Atari STACY, we have refurbished models available for $999! Don't miss this -- this could be your last chance to get one of these classic machines!

ATARI 1040ST and 1040STE Computers!!
We have used Atari 1040ST computers available for $199 and used Atari 1040STE computers available for $299! New STE computers available too! Call for pricing! Order yours today!

HIGH DENSITY DISK DRIVE KITS!
Buy the best ST High Density disk drive kit now for just $89, including the floppy drive! FANTASTIC DEAL!

FALCON POWERUP 2! GO TO 32MHZ with your FALCON030!
Take your Falcon to new speeds for just $79!! Normally $99! SAVE NOW!!

XTRA-RAM DELUXE FOR ATARI ST!
Atari ST 2/4MB RAM UPGRADE AVAILABLE FOR JUST $49.95! NOW THROUGH 12/23/96! GET IT WITH 4 1MB SIMMS FOR JUST $99.95!! SAVE TODAY! OR GET 4 1MB ST SIMMS FOR JUST $49.95! SAVE NOW!

ATARI ST, PC & MAC BEETLE MICE! Beetle Mouse for Atari ST available now through 12/23 for just $29!! SAVE NOW, ORDER TODAY! PC Beetle Mouse PS/2 or Serial just $20, Mac Beetle Mouse just $20!!

AMAZING CD-ROM SPECIAL!! AVAILABLE NOW THROUGH 12/23!!
Get incredible prices on Atari CD-ROMs published by Toad Computers, now through 12/23/96!!

Bird of Prey.....$19.95
Atari Compendium.....$19.95

Suzy B DOUBLE CD SET.....$24.95

Or get ALL THREE for just $49.95! That's right! Just $49.95 for ALL THREE
CD'S -- this is our LOWEST PRICE EVER ON THIS SET OF EXCELLENT CD's!!

GEMULATOR 96 + MAGIC 2!! NOW THROUGH 12/23/96 JUST $99.95!!
Run your favorite ST Programs on your Windows 3.1/95 machine with GEMULATOR '96 and MagiC 2 -- the first ALL SOFTWARE Gemulator solution. Also works with Magic 4!! Call for more details!!

ATARI PORTFOLIO ACCESSORIES -- GET THEM WHILE YOU STILL CAN!! The Atari Portfolio PC Card drive allows you to read and write Portfolio memory cards using a standard PC! Now just $19.95 -- THROUGH 12/23!! ORDER TOADAY! Also available: 64K Portfolio Memory cards -- just $9.95!! Order yours TOADAY!

SOUNDPOOL ANALOG 4/8, FDI, and other MUSIC ACCESSORIES! Available at amazing prices through 12/23! Call Jennifer at (410) 544-6943 for latest prices and to order! We also have a full line of Atari music software and
accessories available, at incredibly affordable prices!!

UNITOR MIDI/SMPTE EXPANSION UNITS BACK IN STOCK AT $349!!! Also available
are MO-4 (Midi-out 4 MIDI Expansion), Export, and others! Call Jennifer at
(410) 544-6943 for the latest prices, SPECIAL THROUGH 12/23!!

FANTASTIC ATARI JOYSTICK EXTENDERS ARE PERFECT FOR 1040/FALCON OWNERS!
Tired of the silly, under-the-keyboard joystick and mouse ports on the Atari 1040ST/E/Falcon? Well, banish them forever with these simple custom
manufactured JOYSTICK EXTENDERS!! GREAT STOCKING STUFFERS! Just $4.99 each
with any order!

ATARI CX-40-LIKE JOYSTICKS FOR ATARI/COMMODORE!
Still available, these sturdy joysticks are reminiscent of the original Atari CX-40! Just $8.99 each or 2 for $12, these are a fantastic deal!!

ATARI ST CHIPS AND IC's -- AVAILABLE!!

CO25912 MMU.....$5.00
CO25914 VIDEO SHIFTER.....$5.00
CO25913 DMA CHIP.....$5.00
CO25915 GLUE CHIP.....$5.00
WDC1772 DISK CONTROLLER.....$5.00
THESE PRICES GOOD THROUGH 12/23!! CALL FOR OTHER ST PARTS!

ATARI ST MONITOR SWITCHBOXES!! SWITCH EASILY BETWEEN COLOR & MONO!
Great deal! Now switch between color & monochrome monitors, without ripping your back out!! It's just $14.95!! Price good through 12/23/96!

WARP 9 FOR ATARI ST -- NOW JUST $19.95!! PRICE GOOD THROUGH 12/23/96!
LDW POWER FOR ATARI ST -- NOW JUST $29.95!! PRICE GOOD THROUGH 12/23/96!
PRINTMASTER PLUS FOR ATARI ST -- NOW JUST $14.95! THROUGH 12/23/96!
AdSPEED ST/STE -- JUST $99!! PRICE GOOD THROUGH 12/23/96!
MEGA STE/ST/TT030 KEYBOARDS -- JUST $99.95!! PRICE GOOD THROUGH
12/23/96!
HD DRIVER v6 UPGRADE -- JUST $19.95!! PRICE GOOD THROUGH 12/23/96!
CUBASE AUDIO -- JUST $399.95!! PRICE GOOD THROUGH 12/23/96!

Order between now and 12/23/96 and receive a GOLDEN IMAGE BRUSH MOUSE
free
-- just for asking!! All you have to do is ask!!

ALL THIS PLUS HUNDREDS OF OTHER ATARI ST/JAG/LYNX ITEMS IN STOCK, READY
TO
SHIP TODAY, IN TIME FOR CHRISTMAS DELIVERY!!

Ask about our great prices on PC systems, too!!

IF YOU CAN WAIT TO ORDER, YOU'LL PAY MORE IF YOU DO IT AFTER 12/23/96!!

  stosser@airtime.co.uk (Tony Greenwood) said:-

> hmmm I would seem to agree with this, but how many C programmers dont
>know how to compile there own code?

You'd be surprised. Even more surprising is you never have to if you
dont want to. To see why, you'll have to wade through the following
waffle ...

Most people will probably never make their own libaries but I know of
no C compiler that does not posess the tools to do it if you want.

When you first get into C, you tend to write one big program. This

soon expands into one big program which is divided up into functions. Many people go no further than this because they don't know that you can, don't need to, or think the next bit is too scary! ;-)

Of those that do, the next stage is to split up the program into separate files. You tend to group functions together according to a certain purpose which makes the management of large projects much easier - and you write a special text file called a makefile. In this you tell the compiler which files depend on which others. When you compile, the "make" program only runs the compiler on those files which _need_ compiling. On the first ever "make", everything has to be compiled but thereafter only those files which have been altered, or depend on ones which have been altered, are ever recompiled. Thus, this drastically reduces the time taken to recompile (ie debug) large programs.

When compilation is finished, the linker examines all these compiled files (object files) and tries to put them all together into one file which will be the program (executable). It does this using a symbol table attached to each object file by the compiler. The symbol table contains the names of all the functions and variables which are used in that object file. It looks through them all and starts building the executable file by merging the object files into the executable file, one by one. There is enough information in the symbol table for the linker to ensure that where a function in one file calls a function in another file, that the function will indeed be called (no flames about scope please - this is complex enough!).

Having done this it is well on the way to having an executable file. There's just one more bit. If the symbol table contains any functions or variables which are still undefined then this is where the libraries we have been discussing come into play. It will scan the ones you have told it to use, looking for the undefined stuff, adding it into the executable as it comes across them.

Anyway, most people writing large projects have no need to add their object files into a library (performed simply by using a tool to add the object files). All a C compiler does is go through the stages described above with the sole purpose of finding "undefined stuff". If anything is undefined at the end it comes up with an error (usually). It will come up with an error if it finds two different things with the same name (usually).

Hmm, that was hard to write. Even authors of only half decent C books have just gone up a few points in my estimation! :-|

That small list enables you to do just about anything. You can do
loops and make decisions just like any other language. The powerful
bit is being able to make your own language up (within the syntax
rules of C).

A simple ...

typedef signed short Wibble;

.. at the beginning of each program allows you to spend the rest of
your C programming days declaring 16 bit values by the name "Wibble" -
it is now part of the language! ;-)

More powerfully ...

```
typedef struct     {
char forename[20];
char surname[40];
Wibble   age;
}    BOD_INFO;
```

.. makes declaration which allows you to group your data together in
a nice logical way. C now knows another name, "BOD_INFO" and it also
understands that it is quite complex ...

```
main()
{BOD_INFO bo[2];

 bo[1] = bo[0];
}
```

.. is something similar to (not done basic for years) <G> ...

```
main()
{/* BOD_INFO - sort of, cant do it exactly the same */
 DIM forename$[2][20];
 DIM surname$[2][40];
 DIM age%[2];

 /* bo[1] = bo[0] */
 forename$[1] = forename$[0]
 surname$[1] = surname$[0]
 age%[1] = age%[0]
}
```

.. C can do a *lot* of work with very few statements.

> I would hate this to get into a debate, as I dont fancy getting even

But it is mainly machine code though isn't it? If not I've been
labouring under totally the wrong impression!

>It CANNOT be written in STOS, which is the key difference between this
>and a C library.

Assuming I'm not wrong above then we are simply looking at it from
different aspects. I'm calling it a library because it is possible to

add to the language. Granted, it's equally possible to say it isn't
because STOS can't produce one! ;-)

Interestingly, the command line in the base page is a Pascal string.

m > There are two good PD C compilers available.

I've always regarded "good PD C compiler" as a contradiction in
terms. Pure C is my third C compiler, and makes the others look
like ... PD software. (I especially like the hypertext help
feature.)

 why not?.....can't you see?
 I program in BASIC, I am a BASIC programmer, If I could program in the language needed to make extensions then I would not have much use for BASIC?
 You can NOT write extensions in STOS BASIC, and that is how I base my argument that extensions and libraries are not the same? they are not subroutines to be called when needed, they are addon commands to the STOS BASIC Language package,

Swampy!....I just snipped what i presume to be some sort of prigramming code, can you please tell me, what in your wildest dreams was this supposed to mean to a BASIC programmer, was I maybe supposed to understand ANY of it?, it is a different language,

and you entered this thread as the person to tell everyone what C libraries and STOS extensions have in common?, I would venture to suggest that your knowledge of C is beyond question and I bow to that fact, however I would equally suggest that your knowledge of STOS is guesswork ?

NEXT! :)

BTW Swampy, next ATARI shows are at the end of APRIL , get there earlier than closing time and we wil meet up, yeagh <giggle>, seriously :)

Cheers.....!ynoT

No, I don't. Maybe those people are a bit shy and dare not to speak in the open? And this thread is no more waste of time then to write software to such an obselete system as the Atari. ;-)

No, it isn't. The 68000 itself has only 54 different instructions. Never had a problem with that. The simplicity of C is regarded as one of it's strengths. One of the best books about C, 'The C programming language' second edition, by Kerningham and Ritchie, is in the english version only 260 pages and but covers the whole language. It's the only book about C I have and I didn't even read it to the full extend. The first 4 chapters (100 pages) are enhough to get started.

> so <?> eeerm wheres the flair? wheres the programming, is it just a
> shell calling all these libraries?, why does it sound so...simple? I
> am not being insulting , I really do not know?,

Depends on what you are doing. But most command you are using in basic are also implemented as function calls. You don't see it, but a command like print is translated into a call to the print function with a set of parameters. The advantage of C is that you can replace the print command (called printf()) with your own version, because it's defined in a library which you can replace.

> BTW the only reason I have not got into C, is that i can find no
> simple tutorials, most start by presuming you already know something
> about C,

Just get a copy of 'The C programming language' by K&R. Make sure you get the second edition, that covers ANSI C. It's available in most public libraries and in any bookstore with books about programming languages.

> hmmm I would seem to agree with this, but how many C programmers dont
> know how to compile there own code?

Compiling code is no problem. Compiling a library is somthing different. You have to tell the linker how to make the library. I think most C coders never build a library of their own. May be wrong though.

I might be wrong, but even GNAT doesn't cover the whole ADA programming language, but only certain parts of it. And, doesn't GNAT convert ADA to C to compile it with the GNU C compiler?

Oh yes, borland C++ 3.x is a real nightmare, fully agree!

Depends on what type of game you want to make. Only for the Arcade type of game the blazing fast incopmatible screen output is needed. For boardgames, simulation games, adventures, any game not requireing realtime action, GEM is fast enhough, and, because it is working on any TOS compatible machine, GEM is the way to go for those types of games.
Bye, Hans

BTW: did you know there is a game library for Gfa basic? Neighter did I, but I saw one on the fair last Saturday.

Hmm... maybe... from C etc if you compile only a single object with
the relevent header info as static const etc. at the top. You would
be limited in what you could do (no malloc()'s etc.) but it should
work... maybe...

>> A STOS BASIC programmer like myself, cannot write an extension?
>
>Why not? All that's needed is the info on how to add a command and a
>command to add.

No. It would not be possible to use a STOS program as an extension
to STOS because the compile always compiles complete executables, which
include the initialisation routines which eg. install STOS's trap
routines, and there would be no way to put the header at this point...

>That's my point. You could add them yourself. Why not write a tool to
>do it?

No, you couldn't. It would not work without resorting to another language.

>Does the STOS compiler insist on using the source for libraries?

No.

>The compiler can build an executable program without the source code
>for _any_ of the above functions. The only source code it needs is the
>above. So I still maintain that STOS extentions and object libaries
>are identical in terms of use. ;-)

I do not believe that it is possible to build a STOS extension from
within STOS itself, which is possible under C. I am not even sure
that it is possible to do it with other languages other than assembler.

Anthony

Yes, but this is not possible without the source code to the desktop. This
is why the replacement desktops (thing, teradesk, gemini etc.) support this
but NewDesk and Desktop do not.

I think your best solution is to use a replacement desktop, which will
support AV_START messages. This is even nicer under a multitasking OS, but
you say this is not practical for you. ok - but it is still of benefit under
SingleTOS.

Either you include code for all known (and still unknown!) video hardware,
or you have to use GEM. I know at least 9 different video modi for known
video hardware... (st low/st mid/st high are ONE of them, 32 KB video ram
direct accessible via XBIOS pointers, color depth 1/2/4 bit, interleaved
bitplanes. ET 4000 compatible graphic cards are another one, there are
a wide variety of high and true color modi and so on...)

I've never seen a none GEM game that supports more than 2 resolutions.

If you really find a game for a new ATARI, I doubt that it will run
on the different hardware of another new ATARI. (Please pay attention
to the plural in my statement.)

>with this?

STacy and ST Book are not able to display st low.
Medusa & Hades (ISA/PCI graphic card) are limited to at least 640x480 pixels.

>Games shouldn't really be run ontop of NVDI, MultiTOS, loads of DA's
>etc. - you SHOULD clean boot anyway. (this isn't just STOS games btw. Comercial

Not always. You can fix some bugs in Civilization by loading the right
extensions...

>>Can a Programming Language be the best of all, if the resulting program
>>won't run on new ataris? Hhmmm....
>
>I dont know where you got this from - All atari's should be able to access ST-low

See above.

>(unless you only have mono monitor, of course :)

ATARI have sold more monochrome than color monitors.
This is not representative because you can use a tv set. But all atarians
I know own a SM 124/144/146/194.

I have to say that from the survey i made, most of the atari users
have hard drive. It is true.
(Survey results available on my homepage BTW)

Ohh too bad, a french guy was giving away for FREE his whole
documentation about the DSP for falcon.
You would just have to pay for the postage fees.
It was something like 2 or 3 months ago now..
I think it was frederic mora, I don't remeber his address, you might
ask in comp.atari.st.fr if he still has it..
Bye

Hi ..

Today I had a chance to check out a SGI-machine. Not to mention that the whole thing was really impressing (speed/graphics etc) but what I liked most was a demo wich is called (I think) flying buttons.

Clicking on a button caused the button to grow, spin around in a 3D style until it's "backside" filled the whole screen, showing another screen.

Is it possible to implement something like that on the Falcon or under Magic on a faster machine (eg. a powerMac ?)

I hope I'm doing this right...

My name is Janet , Paul Bakers wife

In case you are wondering why you haven't seen much of Paul in the last 3 months or so , I have decided to tell people what's going on as he is still not able to talk about it much.

PLEASE don't reply to this message as he doesn't know I'm sending this , I will be deleting this message afterwards.

Pauls mother died from cancer about 3 months ago , since then he has been in a battle to get his mums items from the theiving bastard that she was living with at the time.

The guy has been constanty hastling his grandfather for money to pay for the funeral even though he was never paying for it in the first place.

This has caused his grandfather who had a weak heart to have several heart attacks , he is currently in hospital under observation.

There is currently a legal battle going on , the guy his mother was living with ordered the funeral (evan though he had not intention of paying for it) , the estate may end up footing the bill , the funeral directors won't release the ashes until the bill is payed.

So that's about it..

Like I said , PLEASE don't reply to this as I don't want Paul to see this , but that's why he's been missing a lot recently.

<G>

My mother once asked me do do just that when she bought one of those
knitting machines that takes punched cards. Would have been
instructive I guess but I just wasn't interested enough in the
problem!

No need to understand any of it - just the fact that the only source
code required is what you saw. The rest was done previously.

>guesswork ?

Exactly! :-)) I got the STOS interpreter off a cover disk once and
even went so far as to order the compiler but the disk was duff and
after some altercations with unsaid mail order company I just sent it
back. Does that make me an expert? hehe ;-))

>NEXT! :)

I'm certain it's possible. It being practical is another matter. It may indeed be worth the effort if (say) complex math were required as the C math library could be used, but if someone's math is up to the job and so is their assembler then still no point in bothering.

>No. It would not be possible to use a STOS program as an extension
>to STOS because the compile always compiles complete executables, which
>include the initialisation routines which eg. install STOS's trap

I'm beginning to get the picture. The "tool" would have to locate all such initialisation, rip it back out and then produce a correctly formatted extention - almost definately an impossible job.

>>Does the STOS compiler insist on using the source for libraries?
>
>No.

Then might it be possible to produce precompiled "functions"? Erm, hang on - how do these libraries work? STOS hasn't any named functions or procedures has it?

>I do not believe that it is possible to build a STOS extension from
>within STOS itself, which is possible under C. I am not even sure
>that it is possible to do it with other languages other than assembler.

It should be possible but intimate knowledge of STOS and the compiler would be needed. A compiler which allows inline assembler might be capable but reguardless how I word it an assembler interface of some kind would be required between the two, if only to preserve registers, stack etc.

Well, look at The change from Papyrus 3.x to 4.0. the 3.x was written in
GFA Basic. the 4.0 was written in C. everybody I hered talking about it
said that the newer version did not only provide much more features, but
also was very noticably faster than the old version. I don't know
anything about game programming, but for serious apps Basic does not
seem to be the best language.

Actually I see more C-Stuff than anything else - well I'm a UNIX Fan...

> : >Perhaps you should try looking outside the (very) small world of BASIC
> Visual BASIC is very very popular on a platform that has something as
> structured and powerful as VC++??

I did not try Visual C++. Visual Basic was a serious pain in the ass for me. The Compiled Program was so slow, that even a ST could beat a Pentium with similar Code written in C.

This is definately not because I'm not a good Basic Programmer. I wrote lots of Basic Programs on My old C64, and when I got My fist ST Omicron Basic came with it and so this was the first language I used on it. I never touched Omicron Basic again since I got PureC on my machine.

Another point is that I can use many parts of my code more often. I know, Basic can also use code as modules, but the concept I found with C was miles better than the one I found with Omicron Basic (and that one is said to be good for a Basic). So I don't spend so much time coding everything twice and again.

> : make a serious application that needs GEM you see <duck!>
> Sigh and we were hoping for a decent GEM game... :-)

He said "serious"...

> Visual Basic is more powerful than my C compiler! No easy database support..
> No easy GUI...

Visual Basic is not more powerful than My C Compiler. No Data structures.. No tricks for saving time (Comparisons e.g. can be tuned a lot in C - On a Pentium (to speak about Visual Basic) this is very useful, because it wastes a lot of time for each comparison).

For easy GUI I can use a cool Libary, or tools like ACS. For Database support.. have you ever seen the msql API for C Programmers? Or have you seen embedded SQL for C? Don't tell me that there is a better Interface to relational Databases (Acess - whitch is uesd with Visual Basic - is also a relational Database).

Well, Sozobon I think does not compile the Standard. It lacks in some
Libaries, and the OS libaries are not in all aespects combatible to
other C-Compilers like GCC, PureC, etc. (they say...)

> how about...eerrm tutorials or something, something for the complete

Try the book by Kernighan & Ritchie. Those two invented C and developed
UNIX in the old days. This is the (IMHO)best book for learning C.

>ALL atarians I know own a HD.

Both of them?
90 percent of ATARIans I come into contact with, do not own hard drives, and before I got a modem and went on line, NONE of the ATARIans I knew owned a hard drive,
How many?, well a couple of hundred readers of the STOSSER diskmag who filled in questionaires, only the odd one owned a Hard drive,

ST Format ran polls every year, Hard drive owners where in the minority every year,

Now I am on line, just about everyone you meet has a hard drive (yes I am jealous), but again according to polls in mags, the ATARI on line community only account for ten percent of the whole ATARI community, I think ST Format was a world? wide publication?, so on liners fall into a false sense of ??? eeerm, we on line are in the monority:)

At the recent uk shows, 500 questionaires where handed in, only 7 percent where on line?

>> AW Give us a break, you have to draw the line somewhere,

>> Q when is an ATARI not an ATARI
>> A when it cannot even handle standard ATARI screen resolutions

>Is an ATARI STacy and an ATARI ST Book not an ATARI?

I am going to have to agree with some members of the knitting class here, this is getting silly, Who the hell is using BASIC to make games for the STacy ???

>> How many Hades Computers have been sold

>More than 300 (August 1996). I suppose 500 until Christmas.

>> How many of these people will want a game made on a ST

>More than you can imagine ;)

that, without being sarcastic, = One!

 Please! you cannot say "It is true". you surveyed the online
community that IS a very small part of the actual ATARI community, and
admmitidly the on line community for the most part do own Hard Drives
(mutter mutter<G>)
 What about the other 90 percent of ATARIans,

 Sorry I in no way mean to belittle your survey,and indeed I was
probably one of the first round to see it:), but it should be pointed
out that it was the on line community, a small minority of ATARI users
:)

 I base those comments on the fact that I am involved or read just
about every ATARI publication in the UK, none of which carried your
survey :)

 So IMHO it is not true, MOST do not own Hardrives :)

 I would agree wholeheartedly, But I already know BASIC and am a
little worried as to how long it would take me to learn C, as I have a
reasonable BASIC head start the GFA should be alright (although I am
finding it harder than anticipated)
 I know nothing about C other than some knowledge re: libraries as
discussed in here, it is hard to try and learn a completely new
language, while still using BASIC to make games (of which I am doing)

OK apologies for what are probably really lame questions, but I am using this forum as a way to get quick and easy answers :)

Why does GFA return 2 bombs when I try to load in a file with the extension *.LST

I have these as source files? well thats how they where given to me, and they certainly look like source in a text editor, but GFA 3.5 returns bombs,
This is under Gemulator and tos 206,

Hi

I am trying to start a program using Pexec mode 4 (just go)
and I believe that everything (ie program, basepage etc.)
is set up correctly but it isn't working. Instead of executing
the program, Pexec is just returning an error code of 'EIMBA'
- invalid memory block address.

What exactly does this mean? I assume it means I am doing
something wrong, but what?

Cheers

Anthony

>
>STacy and ST Book are not able to display st low.
>Medusa & Hades (ISA/PCI graphic card) are limited to at least 640x480 pixels.

Well, in my book, anyone who can afford a Medusa or Hades can afford to go
out and by a second hand STE. I think including these machines in a debate
about (primarily) arcade games is pointless. 99% of arcade games go
wrong when played at the wrong speed. This is simply because they are
highly dependent on timings... even the difference between 50 and 60Hz
makes a difference...

>>Games shouldn't really be run ontop of NVDI, MultiTOS, loads of DA's

>extensions...

One example... but in general, most game software prefers clean systems,
even if it is only for the extra memory!

(but both Robinsons Requiem [Falcon] and Zero-5 do not work correctly
if run from 256x640x480 on my Falcon.

>ATARI have sold more monochrome than color monitors.
>This is not representative because you can use a tv set. But all atarians
>I know own a SM 124/144/146/194.

Well, I know 3 atarians with mono monitors, and all 3 of them also have
colour monitors as well. I know significantly more that only have colour
monitors/TV's.

>>And yes, you can even make use of it - I have written myself a .TGA viewer
>>which uses 640x480xTCxVGA mode and hardware scrolling for big images...
>
>Can I use this on other hardware with the same resolution?

nope. written for my own use, with my own hardware. I jst used it of an
example showing that STOS *can* make use of extended hardware, *if programmed*
to. This is the same as other non-GEM software. [Bad Mood v2.15 can now make
use of a NOVA graphics card, *now that it has been written to support it*.]

>(What do you mean with TC, 16 bit high color or 24 bit true color?)

I mean Falcon True-colour mode. 16-bit.

>
>Have you seen the install software of some german software?

nope, because most of it doesn't make it to this country... ;/

>Why do you want to uninstall atari software? ;-)

hehehe... well, maybe if it is to big/slow?

>>>A faster CPU can compensate slow code. GEM code is mostly slow code.
>>>To make good GEM games, you can compensate the slow but compatible
>>>GEM code with a faster CPU.
>>
>>That sounds like a Micro$oft approach to me...
>
>Is there anything false in my statement? So what...

No, there is nothing false in the above. However, it makes slower machines
redundant. There are FAR more ST's out there than Falcons, TT's and Medusas
all put together, so why make games that the majority of users cannot use?

Yes, fine, write games for powerful machines (I am doing this), but please
do not expect ALL games to be for powerful machines. This is what you are
doing, if you are advocating the use of GEM for games programming.

I've been using v3.5e for many years on Atari systems and have never
experienced a bomb while merging in a .LST file. Does it still load
in .GFA files with no problem?

Take a look at Motorola's WWW site. It seems they have all their manuals
available there in PDF format nowadays.

 You gave me the answer in the above paragraph, If I load them in,
BOMBS, but if I MERGE them in, then they load alright?
 I never thought GFA would find a difference, i presumed load would
work for both
 So to load a LST file, I NEW, then MERGE and its there :)

 This is the problem when trying to get to grips with another
programming language, you presume some tasks to be normal :)

 Thanks

Cheers.....!ynoT

Yes, and you are forgetting the mighty Atari user base in germany. They don't fill in ST Format polls. In my view ST Format was a game oriented magazine (maybe I got spoiled by german magazines) and I expect a lower harddisk user base among the game adicts.

Does this impressive list of TOS versions mean STOS is still calling routines at fixed adresses in ROM? I thought these practices were something of the stoneage of Atari ST computing. Something of the pre TOS 1.02 age. If that is true STOS will be in a lot of trouble on ST emulators using magic. Because that OS is software is's much easier to update and you won't be able to keep track of all the different versions of that OS.

The game I am working on now doesn't care about the TOS version. The only point of interest is the hardware it's running on. The OS is only needed for memory allocation and some disk acces at the start and end of the game. Oh yes, also for switching to ST LOW on a falcon and, ofcourse, going to supervisor mode. It will work on ST, STe, TT and Falcon (both RGB and VGA).

No problem.. Usually if you try to load a file that is not a GFA
file, an alert box will pop up telling you so. Either that was a very
odd .LST file or GEMulator has a problem with it.

Shure. I did not say that it is impossible to write serious Programs in
Basic. The question is just if there is a better solution.

> I would agree wholeheartedly,

<habby and glad> ;-)

> But I already know BASIC and am a
> little worried as to how long it would take me to learn C, as I have a
> reasonable BASIC head start the GFA should be alright (although I am
> finding it harder than anticipated)

It did not take me too long. When I started with Omicron Basic I found
out rather quick, that structuring programs in procedures and functions
is a good idear. I then was impressed by the - definately better - way C
deals this. It gives me the possibility to really modularize most of my
code.

> I know nothing about C other than some knowledge re: libraries as
> discussed in here, it is hard to try and learn a completely new
> language, while still using BASIC to make games (of which I am doing)

That is exactly where I started. One of the advantages of C is that the
structuring of the Programs is very consistent. So there are no special
Key words for end while, or end if. Such statements like while or if
just handle a block, and a Block is either a single statement, or is
some statements written in curly braces.

In short terms C is rather easy to learn (compared to other languages).
It took me just a few days to get my first real Program with Grafic
Output etc. running. As I said I never started Omicron again since I gon
PureC.

Pexec can be a bit tricky.
It is essential that you do the memory handling the right way.
TOS must have a free block of memory that is big enough for
the program. What happens if you call GEMDOS Malloc?
Is there any memory free?

>formatted extention - almost definately an impossible job.

yep...

>Then might it be possible to produce precompiled "functions"? Erm,
>hang on - how do these libraries work? STOS hasn't any named functions
>or procedures has it?

no, it doesn't have named functions/procedures. The extensions are implemented by adding extra tokens to the actual language itself. All instructions are represented as a 2 byte code, the first of these identifies which extension (or internal) and the second identifies which instruction. The header of the extension gives the tokens which are understood, followed by the offsets to the code for the instructions.

(btw. extensions are only aware of the instruction token - the extension
 token is allocated when the extensions are loaded)

The exact syntax of the compiler libraries are different from interpreter libraries. Also, compiler libraries have to be in PC relative code.

>It should be possible but intimate knowledge of STOS and the compiler

Yes, I think you are right about that... Maybe it would be worth me looking at this sometime...

Anthony

This isn't just the German viewpoint. In the days when the UK had a
choice of magazines, ST Format was always the most trivial by far,
although it did improve toward the end. I seem to remember an Atari
World survey that showed a much higher hard-disk ownership ratio than
Tony is implying. It'll be interesting to see the results of the Atari
Computing survey from issue 1. Certainly everybody I know personally
with an Atari has a hard disk and I live in the UK (the Swedish tag on
my e-mail address is just there to confuse ;-)).

 Yes I do keep falling into the trap of talking about the English
ATARI peeps, can't think why that keeps happening! :)

>fill in ST Format polls. In my view ST Format was a game oriented magazine

 yeagh!, strange?, did you read it or just listen to the gossip and
not bother,
 I had a few programs on stf cover disks, not all games, and I had a
small series of programming arrticles published
 Never got a bloody penny for them though? :)

>(maybe I got spoiled by german magazines) and I expect a lower harddisk user
>base among the game adicts.

 ooooer, I am glad I didnt say that :)

Its ok - I managed to sort the problem - I wasn't setting up
the basepage correctly - a couple of entries were invalid.

Its sorted now, but cheers anyway. :-)

Was it?, you write that as if it is fact, that is surely your
opinion, and granted the opinion of many others<G>,

>although it did improve toward the end. I seem to remember an Atari
>World survey that showed a much higher hard-disk ownership ratio than
>Tony is implying. It'll be interesting to see the results of the Atari

But still I think you will admit, the minority?

>Computing survey from issue 1. Certainly everybody I know personally
>with an Atari has a hard disk and I live in the UK (the Swedish tag on
>my e-mail address is just there to confuse ;-)).

aw really, and who where the only people who knew about (the
excellent!) ATARI computing issue 1?, ok maybe not only, but people on
line knew about ATARI computing, not many others did, so any survey
carried out in issue one will be mostly by on liners that we allready
agree are mostly hard drive owners?

Also if you do a survey, and give the option of sending in your
answers via email or by snail mail, then a bigger majority of on
liners will respond, again making the survey a little one sided?

IMHO :)

ST Format IMHO was by far the best magazine ever produced in the UK,
it had everything, yes including mistakes,
The only real gripe I ever had was the page count, but although thin,
they had a lot more pages than anyone else at the end?

At no point in this statement am I saying the others where bad (so
back to your knitting the moaners!) because theye where good, I bought
every one of them, just that IMHO STformat was always the best of the
bunch :)

The problem with ST Format was that thousands read it and liked it,
but it was allways something not many would admit to :)
A bit like the present English goverment, they get enough votes to be
elected, but try finding someone who would admit to voting for them :)

Cheers.....!ynoT

j > - invalid memory block address.

Did you also load the program/basepage using Pexec mode 3?
If not, did you convert the memory references using the fixup table?
Did you pass the basepage address returned by the previous call?

```
base = (BASPAG *) Pexec( 3, prgm, cmd, envp );
if(base) ret = Pexec( 4, 0L, base, 0L );
```

Note: if you try to run the program more than once, all initialized
variables (and the command line) will be modified.

Yep, you're right.
Porting stuff using Sozobon is not a good idea, believe me, I've
tried... The libs are not entirely standard and the GEM libs are't either.
But it's a nice compiler anyway :-)
I would advise Sozobon users to get the MiNTlibs for Sozobon,
it will improve compatibility a bit.

Eh? We are talking about gamers!!!!

>This isn't just the German viewpoint. In the days when the UK had a
>choice of magazines, ST Format was always the most trivial by far,
>although it did improve toward the end. I seem to remember an Atari

Woha! hold on there! STF was really good, and not as game orientated
in the early days as well. STF went through a bad patch, but was beginning
to improve again when it went...

>World survey that showed a much higher hard-disk ownership ratio than
>Tony is implying. It'll be interesting to see the results of the Atari
>Computing survey from issue 1. Certainly everybody I know personally

Again, I think this will be biased, as the people who learnt about Atari Computing are online, or regularly contacting di-hard companies (sys.sol, goodmans pdl etc.) I was away from uni, and I only found out about it via the limited email access that I had from home. If I had not had this, I would not have known about AC until getting back here...

Anthony

Is there a book, CD-ROM, or FTP document that has *detailed* info about programming a 100% compliant CPX, explaining what is needed to transform a small APP into a CPX that will work on every Atari from TOS 1.0 to 4.04, and specifying the un-documented calls that should be avoided (ie: CONFIG.CPX and others used some calls only known to Atari-commissioned programmers that cause conflicts when running under certain TOS/AES versions, but were reported through various newsgroups)?
The information source should be preferably in English or French, although if all else fails, I almost remember having learned some German in hi-school...
Thanks to anyone who can provide me with any info about this ;-)

After Receiving Major Feedback and Encouragement re: HEARTLAND we decided to go with the flow, although Heartland was intended as a simple platformer that was fast and easy to use, plenty of you asked where the Puzzle was, so here it is, enjoy, but most of all COMMENT as that is the only thing that keeps us going,

*** IMPORTANT *** It is strongly advised that Floppy disk users read the on disk documentation in order to set up their disk for the Save/Load features,

Cheers.....!ynoT

Hi everyone,

Is it possible to get Linux running on a 520ST? I know the Linux docs say you need at least a 68020, but is there any way around this? I'd also like to upgrade the RAM and such, any advice?

Chris

As far as I can tell, you need at least a 68030 with a PMMU chip. This
appears to be just the way Linux was written, and would appear to be very
difficult to change.

Cheers,

James Cox

Hi , WHat is the best way to manage memory in ACC?
I've read that Malloc is no good in ACC. True or not?
If true what would be the solution?
and could you show me an example, do I have to use reserve? inline? or
what?
HELP!!!
Thanks.:)

I may have missed a few responses on comp.sys.atari.st due to my 200 msg/day limit (now 400). Also, I'm going to be out of town for a while. Could someone keep track of any additions for me?

The current list is:

English "[3][Cannot load RSC file!][Abort|Search]"
Deutsch "[3][RSC Datei nicht geladen!][Abbrechen|Suchen]"
Nederlnd "[3][Geen RSC-file!][Afbeken|Zoeken]"
Svenska "[3][Kan ej ladda RSC fil!][Avbryt|Leta]"
Francais "[3][Je ne peux trouver |le fichier RSC!][Quitter|Chercher]"

I have several different French translations (all different), all using "trouver" which I believe means "find" rather than "load." rsrc_load() can fail for other reasons than not finding the RSC file. This might be confusing if one has used the "Search" button, which brings up the file selector, in which case you would KNOW whether the RSC file has been found or not.

New version of NoCrew's MPEG Audio Layer II realtime DSP player for Falcon
is out now!!

Latest version is 0.95 with lots of new features from the last one. (0.7)

* Dynamic buffer allocation
* Config file
* Drag & Drop protocol supported
* VA_START message supported
* Keyboard control
* Automatically find the next song
* New buttons:
  * Skip to next
  * Skip to previous
  * Fast Forward
  * Count direction

Read more about this product on http://noring.org/mp2 where you also can
get the latest version. It can also be found on ftp site:
ftp://ftp.nocrew.pp.se/pub/nocrew/tos

Download, unpack and blast away with your mp2 songs playing in the
background, taking no CPU time!

Mpeg songs can be found at http://www.iuma.com or ftp://ftp.iuma.com

!!!!!!!!!!!!! NOTE !!!!!!!!!!!!
ONLY STEREO SONGS ARE SUPPORTED

Let's hear now what the public has to say about this.

Anders Eriksson, aka Evl of DHS: "BLOODY WELL DONE!!"

I'm not sure if he was talking about the player or his dinner though.

This is a dream coming true for every Falcon user, try it now!!
Send donations afterwards! :)

Tomas

Hi!

Inline isn't very good, cause it can only handle 32767 bytes max.

One thing you can do is declare an array of value like this:
To reserve 102400 long words - 409600 bytes.

```
DIM a%(102400)
ap=V:a%(0)
```

ap would then be a pointer to the reserved space.

Hope it helps!

reply-to: gary@the-gap.demon.co.uk (Gary Priest)
newsgroups: comp.sys.atari.programmer

I'm very confused and I've looked at the MagiC5 documents.

How can I launch a program (say CAB) from another program, AND leave the original program running?

Magic5 doesn't support Pexec (load,go,don't wait).

Magic5 doesn't 'seem' to support mode 0 of shel_write.
Mode1 is no good because it doesn't launch the program until the calling program has exited. :(

Help!!! Does anyone have any idea how I can do this?

I'm not interested in sharing memory or any of that stuff. Just a straightforward start another program.

Thanks for any advice,

Gary.

I'm having trouble making sense of the docs on the basic ST sound chip. What exactly is its relationship to the floppy drive? When talking to the sound chip directly from within an interrupt {not using xbios}, I get the right sounds, but then can't access A: until after rebooting. I masked interrupts while writing to the psg, thinking it might prevent conflicts, but it doesn't seem to matter. Any ideas? I can post some assembly source here if the solution isn't obvious from this description. -- Mark

Does anyone know how to set environment strings such as BROWSER=C:\CAB.APP in versions of the AES prior to 4.00 (4.00 uses shel_write). Magic uses Magic.Inf similarly so does MiNT. But how do you do it with say, good old TOS 1.02?

All AES's have shel_envrn for reading them, so it seems a bit odd that you can't set 'em!!

Thanks for any advice,

Gary

Hmm, this seems familiar ;-)

I've recently been through the same problem in this very newsgroup. The answer is to use shel_write() mode 1 for MagiC with a shell parameter of 100. Note, with mode 1 you will also need to test if the program to be

launched is TOS or GEM (if you don't know this at compile time). Also,
if you want your program to run under other multitasking systems as well
as MagiC you will need to test for which is in use and use shel_write()
mode 0 for MultiTOS and Geneva.

Hope this helps

Regards
Martyn

Hi Tony,
   GFA will only allow you to 'merge' *.LST files (as far as I know). If
you try to 'load' it assumes you are trying to load a *.GFA file!

Hmm, this is the second post about environmental varaibles, must be that
time of year :)

You can set environmental variables with several programs, such as
SETENV.PRG or the CPX version. These are available from umich.

Basically, you set up a file with all of the environmental variable
strings, & this is read by the setter program & the variables are set.
This works for TOS,MiNT & probably anything else.

You can set enviroment variables for the GEM desktop and all programs
launched from it with the GEMENV program:

http://sunsite.doc.ic.ac.uk/packages/atari/umich/Programming/gemenv.lzh

Get a PAK 68/3, that replaces the 68000 by a card with a 68030. You'll need at least 4 MB, 8 MB is not wasted at all. I assume you got a large enough harddisk.

If you lack memory as well as the PAK, it's probably cheeper to lay hands on a used Macintosh, the ones with 68030 are really cheap nowadays. If you wanna stay with Atari, look for a used TT.

There are ways to do so. The 68030 integrates the PMMU on the same chip.
Linux is a real Unix derivative, as such memory protection and mapping is
an inherent part of the kernel.

You haven't locked floppy access. Use the flock system variable to
synchronize your access to the sound chip with the OS. The problem arises
from the soundchip having multiplexed registers. The OS relies on a
certain register being selected, while your interupt fires and selects
a different one.

There is one point you are allowed to Malloc memory in an accessory, that is *before* you do the first AES call. That is normally appl_init(), so you cannot have any user interaction before the Malloc. However, files can be read, for instance, as you don't need AES for that, but you cannot use the fileselector to locate it.

With GFA be careful, which command might contain hidden AES calls.

System variable the_env at $4BE points to the default environment string.

The problem is that the normal environment string cannot be expanded. You need to replace the string with a larger buffer using a TSR. Then just add on the the end as needed.

Port A of the PSG is used to control certain floppy functions (among
other things).
Port B of the PSG is used to drive the centronix printer port.

Bit 6 of register 7 (Noise/Tone Mixer) controls whether Port A is
used as input or output, and bit 7 controls Port B.

These bits should always remain set!

No, I didn't say that. When someone is claiming a language is the best game language, without specifying the game types that it's best for, nor the computer you are developping for, such a best language has to be able to do GEM games, it has to be able to generate on Medusa and Hades. Otherwise he has to set some boundairies like 'the best for arcade games for ST's'.

>> BIOS/XBIOS-support stinks too.) but it really isn't relevant here.

Thanks for mentioning that. (in my defence, I typed that code directly into my newsreader (tin, running on my ISP), I didn't want to have to load 4-5000 lines of source and then eradicate all bar perhaps 20

I still feel uneasy about copying a fixed-size block of param data from the stack, though.

(My API has all data on the stack - GEMDOS/BIOS/XBIOS-like).

Perhaps I should implement a new version 2 API which uses a pointer to a parameter block? This would break the simple-to-implement and fast-to-access-parameters ability of the code.

Subject: Devpac 3.1 bug? (Multiple REPTs in a MACRO)
Date: 1996/11/30
Message-ID: <b1e7cc$17a4.110@HERMES>#1/1
X-Deja-AN: 201547660
newsgroups: comp.sys.atari.programmer

I've come across a bug in Devpac 3.1 whereby having more than one REPT loop in a MACRO will cause it to fail with a "can not nest REPT loops" error.

The code calling it is not within a REPT loop, either.

To create the macro, I simply lifted a working piece of code (used in three different places in the app), and block copied it to the start of the source file, and wrapped a macro definition around it.

(The code is used in three different parts of the prog, and for speed I would like to keep it as an inline piece of code, rather than a subroutine call - which I would normally do were it not for this). Also, making it a macro means that I can define it once in one place and not have to block copy it multiple times - possibly missing one.

The "offending" macro code looks something like this:

```
Foo  MACRO

     ; some code goes here...

     ; copy text block as longwords
a    set  0
     REPT XSIZE/4
     move.l   xl_1+a(\1),le_1+a(\2)
a    set  a+4
     ENDR

     ; more code goes here...

     ; copy info block by longwords
a    set  0
     REPT YSIZE/4
     move.l   xl_2+a(\1),le_2+a(\2)
a    set  a+4
     ENDR

     ; and yet more code goes here...

     ENDM
```

And then in the source, I call it with the line

```
     Foo  a3,a4
```

so that \1 will be replaced with a3, and \2 will be replaced with a4

But, instead, once it hits the second (un-nested) REPT it gives me that error message.

Neither the manual (for v3) or the v3.1 addendum mention this.

REPT loops on page 99 says nothing, and MACRO operations on pages 110-117 say less than that with regards to this problem.

Ho good, someone who knows all about STOS extensions and all about C libraries, good :)

>A compiler library (this is not C specific) most usually consists of

snippoooooooooooooos

So a C library is a collection of subroutines that can be sort of "called" and compiled into your program, a selection of subroutines written by the C users , in C for a C program? the sole purpose of which is to act as a subroutine that you dont have to keep writing yourself,

And STOS Extensions are the same you say ?

hmmmmmmmmmm thats spooky, because from where I am sat they are a million miles apart.....how do you compute they are the same ?

A STOS BASIC programmer like myself, cannot write an extension?
A STOS extension is an upgrade to the programming language that either replaces existing BASIC commands with new faster ones, or adds new BASIC commands to the language,

From my point of view as a purely a BASIC programmer, Your C libraries are a collection of subroutines written for convenience so you dont have to keep writing them yourself, but STOS extensions are new commands that a STOS user could never write himself,

How do you conclude that they are both the same?

If I get together a whole bunch of my most used sub routines, place them in a folder called "Library" and then rewrite my compiler to include these subroutines when the code it is compiling points to one of them, then is that the same as a C library???, because it sure as hell aint the same as a STOS extension,????

Cheers.....!ynoT

What do you use to develp programs uner MagiC and then debug within the
multitasking environment ? Ok, you can compile C programs with Lattice or
Pure C as a task, but the debugging procedure is much more tricky.... can it
still be done, or is it necessary to switch to monotask ?

You can with Fforce, however writing your own routine would be much more powerful. Knowing that however it gets there almost all text output is going to go via Cconws and Cconout - simply write a TSR to intercept these calls and take it from there.

> thread?

If you alter your statement to read: STOS is the *easiest* BASIC to produce a game in. Then I agree with you entirely but *best* no I'm sorry can't agree there bud, it simply doesn't give you enough system control.

The reason no-one can come up with a good game written in another basic this year is because there aren't any (probably!), doesn't mean to say that if someone had the desire to there couldn't be. Have you seen some of the pre-1996 games written in GFA?

HA!

I just found a game that will match your race!

ftp.cs.tu-berlin.de/pub/atari/Games/Yukon/*

Yukon is a patience clone.
- last version from 16. Aug. 1996
- with sound (DMA sound if available),

  - classic soundset
  - startrek soundset
  - [...]
- GEM GUI,
- 2/4/16/256 colors
- 640x200x4, 640x400x2, 800x600, ... [whatever you have]
  if you have cards for 640x400x2 so they can also be used for any other
  resolution with the same color depth and at least (in this case) 640x400
  pixels.
  (if you need cards for 320x200x16, just create your own, a tool is included)
- runs also with multitasking OS like MultiTOS, MagiC, MagiCMac.

Now it's your turn.

>I will put STOS games on a head to head with any others, and win...

Show me a STOS patience game that covers all this features.
31 days left...

>>>>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a

> Since when has a powermac been an atari ?

Since July 1995.
(The date of the first official release of MagiC for PowerMac.)

>...and dont you draw the
>line anywhere? how about a jaguar, thats atari,

If I speak about atari computers I mean ATARI TOS compatible computer
platforms and ATARI OS compatible OS. (Original atari hardware, clones,
emulators, MultiTOS, Geneva, MagiC, MagiC PC, MagiCMac, MagiCPowerMac...)

The ATARI 8-bit series, the Lynx, Jaguar, Portfolio and ATARI PCs are
excluded.

>>>>There is no choice between GEM games and none GEM games, because you can

Your older STOS software will run at the technology of 1996 without
modifications?

When going for GEM applications I think you have to go for C. Most literature about the OS and GEM programming is also written with C in mind. Even the whole OS was originally written in C. Pascal can give problems on some points because C strings (as used in the OS) and Pascal strings are fundamentally different.

> > ordered it, I am simply getting a replacement copy of the coverdisk
> > version I have since lost, I am too poor to actually buy new software

There are two good PD C compilers available. The first is GNU C, the second is Sozobon C. The GNU C environment is quite hard for beginners I think and it does definitly need an harddisk. You have a chance Sozobon C (or is it Sosobon C?) still works on floppy based systems.

No, C libraries are more. The command set of C is very limited. The C language it self has only 32 reserved words (that are words you can't use yourself as name of a variable or function):
(auto, break, case, char, const, continue, default, do, double, else, enum, extern, float, for, goto, if, int, long, register, return, short, signed, sizeof, static, struct, switch, typedef, union, unsigned, void, volatile, while)

So there are no print commands, no load or save commands, no memory allocation commands. All that cind of things are done with library functions (C has only functions, no procedures. What pascal calls a procedure is in C simple a function without a result).

There are sets of functions that come with every C compiler. That are the standard libraries. What should be available in the standard libraries is defined in the ANSI C standard. C libraries can be written in C, but also in an other language or assembly. As C programmer you have the possibility to create your own libraries with much used functions.

So STOS is less powerfull as C because you can't write our own extensions. So a STOS programmer is in the same position of a C programmer that doesn't know how to compile a library. From their point of view an extension (library) is a new set of statements (functions) they can use.

> From my point of view as a purely a BASIC programmer, Your C

The whole concept of STOS extensions is covered by C libraries. Only C libraries are a bit more flexible.

> If I get together a whole bunch of my most used sub routines, place

No, a library is a set of already compiled code, just like an extension. You have to tell the compiler which libraries you want to use in your program. But yes, I think libraries are basicly the same as STOS
extensions.

Why made in 1996? A game made in basic in 1987 is still posible to be done in 1996.

>> All those games work on all Ataris, under all resolutions, maybe some

What is an Atari? Any computer that runs TOS compatible OS.

I am real (I think). You have to get real. If you say something about a best language to program games for the Atari you have to face its implications. That includes IMHO Hades and Medusa computers. I had problems on that point my self. Cache memory in 68040+ processors a a lot biger as in the 68030, giving trouble with slef modifying code.

>> Are we allowing C or not? The original statement included C.
>
> Yes we are allowing C, my original statement seems to gain strength
> with every posting you make :)

So Kubis '96 ends the trouble. It's written in C, is a game and runs on every Atari in any resolution.

If you are looking for a debugger go for bugaboo, it comes with the Turbo assembler package. The current version in 1.77. It is shareware, but there are no limitations to the use of the programs. I have been told Sigma soft doesn't support it's products anymore (the two most improtant products of Sigma soft are Midimaze II and Turbo Assembler).

The great thing with bugaboo is you can run bugaboo in ST HIGH and the software you are debugging (games, demo's) in ST LOW. With a monitor switch box you can connect both monitors at the same time to you
computer.

Yes I did. (I have to be carefull with that function because leavin and entering the game too much will lock up the game (all turns black). I can't reproduce this on a plain 1040ST with 1 Mb.)
I don't see a possibility to get to those coins on the map. That's why I am asking you for a hint.

> >> there? And will those eleven coins give me enhough points to break the
> >> 3k limit?
> >
> > what 3k limit?

The 3k points limit. The high score is 3000 points.

> >> (Now I have 2620 points, only the eleven coins and the ace card to
> >> go.)
> >
> > are you sure it is the Ace, thats very easy, its the Jack that has

Well it's definitly the ace (locate at the left side of the map). As soon as I pick up that card the game ends.

> Use the MAP VIEW for the coins.....comments please ?

I did. The original question is still standing. I need help.

>game in. Then I agree with you entirely but *best* no I'm sorry can't agree

 Hmmm I had a long think about this one, yes I agree with you, from
what I have seen of other BASICs then I would have to agree STOS does
seem to be the easiest, this does help my statement, ie: its the best
to use :)

>there bud, it simply doesn't give you enough system control.

 Have you seen anything made recently in STOS ?, to be exact a game? I
can show you a dammned fine game that does not lack anything because
of lack of system control??, therefore your point although true in the
fact that STOS lacks greatly in that department :), would seem to hold
absoloutly no bearing in this debate ?, hehehehe

>The reason no-one can come up with a good game written in another basic this

>year is because there aren't any (probably!), doesn't mean to say that if
>someone had the desire to there couldn't be. Have you seen some of the
>pre-1996 games written in GFA?

 hahahaha yeagh, and nothing GOOD?, but the thread is 1996, the thread is not, lets all move the goalposts and add more bits to try and win the debate, sorry but pre-1996 does not count, STOS was not as upgraded in 1996 as it is now, so hardly fair to change the rules, one of my points is that STOS has been upgraded you see ,

 I have Hisoft BASIC, GFA BASIC 3.5, FirST BASIC and STOS BASIC, from what I can see, if I or anyone else wants to make a game, then STOS wins hands down, why would I want to use GFA to make a game when STOS is there offering a hell of a lot more, and as you rightly say is easier?, because it has GEM support? phoooey, thats what would cripple a good game not be an advantage,
 If I wanted to make ANYTHING other than a damm good game, then I would probably opt for GFA BASIC, I am not saying STOS is the best BASIC, merely the BEST for making games at this point in time ? :), I am willing to put software forward to prove this point, and that is exactly what no one else is doing, thus proving my point,

Cheers.....!ynoT

Abusing a language on the strength of one compiler, which you yourself
admit is poor, is not desperately sound reasoning IMO. Ada has it's
faults, but your argument is no more valid than if I were to abuse C
on the strength of the nasty experiences I've had with BorlandC++
(version 3 or so). Try GNAT under a real OS sometime.

>yourself,

Sort of. The important point here is that at the time a command from the library is referenced in the program the command does not exist and the compiler does nothing about it apart from recognising the fact that the command exists. After the compiler has finished it executes the linker whose job is to locate the command and add it into the program. The command exists as object code _not_ source code. If I knew all the details required (linker format and register usage), I could add a command to your Pascal compiler written entirely in C and the reverse is possible as well.

> And STOS Extensions are the same you say ?

I can't see any reason why STOS extentions could not be written in C, pascal or any compiled language. It's simply an adaptation of the above.

> hmmmmmmmmmm thats spooky, because from where I am sat they are a
>million miles apart.....how do you compute they are the same ?

Same reason as above.

> A STOS BASIC programmer like myself, cannot write an extension?

Why not? All that's needed is the info on how to add a command and a command to add.

> A STOS extension is an upgrade to the programming language that
>either replaces existing BASIC commands with new faster ones, or adds

That's my point. You could add them yourself. Why not write a tool to do it?

> How do you conclude that they are both the same?
>

>hell aint the same as a STOS extension,????

Does the STOS compiler insist on using the source for libraries?

The following bit of code would make a copy of the screen in memory it calculated and allocated automatically ...

```
main()
{VIMG    v;
 Rect    rr;

 appl_init();
 v.vi_vwk = V_Opnvwk(true);
 wind_get(WH_DESKTOP,WF_CURRXYWH,PRECT(rr));
 Img_Grab(&v,rr);
 V_Clsvwk(v.vi_vwk);
 appl_exit();
 exit(0);
}
```

appl_init(), wind_get(), appl_exit() exist in a library called libaes.a.

exit() exists in library. libc.a

V_Opnvwk() and Img_Grab() are written by me. They exist in a library I created called libg.a

The compiler can build an executable program without the source code for _any_ of the above functions. The only source code it needs is the above. So I still maintain that STOS extentions and object libaries are identical in terms of use. ;-)

: the debate, sorry but pre-1996 does not count, STOS was not as
: upgraded in 1996 as it is now, so hardly fair to change the rules, one
: of my points is that STOS has been upgraded you see ,

This is silly! Are you saying that just because a game is written before
1996 it's unfair to compare it with "STOS 96"? If age is an issue here it
should be the other way around! Or are you afraid that somebody wrote a
better game in BASIC already in 1989... ;-)

: is there offering a hell of a lot more, and as you rightly say is

: easier?, because it has GEM support? phoooey, thats what would cripple
: a good game not be an advantage,

Agree. Most GEM-based games stinks. It isn't possible to write a good arcade-game that's 100% GEM-based. Why is GEM even mentioned in this thread at all? Yes, I know that STOS doesn't support GEM (And the BIOS/XBIOS-support stinks too.) but it really isn't relevant here. Compatibility is a lousy argument, GEM-based games are too slow to run on simple 68000 Ataris. And without a 3D AES and atleast 16 colours they are ugly as hell too.

: limiting?, from that description?

No, that exactly what it's not! Because of the very limited amount of reserved words and the standard libraries, C-programs can be compiled on just about any platform ever made.

: so <?> eeerm wheres the flair? wheres the programming, is it just a
: shell calling all these libraries?, why does it sound so...simple? I
: am not being insulting , I really do not know?,

Those reserved words are the core of the language. All those functions and structures that are added by the libraries are just an aid for the programmer. It's the same thing with STOS; you have a lot of libraries (Or extensions as you STOSsers call it.) but they don't modify or add anything to the language. Are there any extensions that adds structural commands like WHILE-DO, REPEAT-UNTIL or CASE, or that let's you define and dynamically create/remove your own datastructures? Nope, only functions.

: BTW the only reason I have not got into C, is that i can find no

: simple tutorials, most start by presuming you already know something
: about C,

Try "C-Manship complete" from Kuma, it's a bit outdated but it's
entertaining and it's Atari/GEM oriented. You should also get "The C
Programming Language" by D. Ritchie, it's the very definition of C and
therefore doesn't assume any previous knowledge to the language.
:
: hmmm sounds good, dunno about good enough for games, but sounds
: interesting :)

I don't know of a good games-library for C either, but as it's very easy
to interface C and assembler it would actually have been much easier to
write "The Missing Link" (Or any other STOS extension) for C than for
STOS.
:
: hmmm I would seem to agree with this, but how many C programmers dont
: know how to compile there own code?

Well, I know how to compile (We're talking about C remember?), but I have
never tried to compile my own library so I don't know how to do that. The
actual compiling-process shouldn't be to hard, it's writing the library
that's difficult. That's why we have libraries...

Well... actually the Control Extension (by Les Greenhalgh - shareware)
adds a CASE statement. :) Oh, and I'm mid way through writing an extension
which dynamically creates/removes data-structures. [TT-Ram only, as

STOS has control over all other memory] :)

You are correct though... (the above use loop-holes)

Any chance of posting it for the rest of us? Or pointing us towards an ftp
site if it's too big.

Cheers,

Xav

No, the point Tony is trying to make is that a STOS extension is NOT simply
pre-compiled code. It CANNOT be written in STOS, which is the key difference
between this and a C library.

Sure thing. Below is a heavily commented C header file from Mario
Becroft. Also attached is an Lharc file containing documentation from
Daniel Hedberg. I haven't looked at this yet since I don't have access
to Lharc at work.

Regards
Martyn

/* The following defines the message numbers for the communication of
 * Venus and other accessories.
 * All path- or filenames that occure in messages are supposed to be
 * absolute pathnames (including the drive-letter) and drive letters
 * have to be upper case.
 * All paths end ALWAYS with a backslash!
 *
 * Messages from Venus start with the prefix 'VA_' (Venus -> Accessory).
 * Messages to Venus start with 'AV_' (Accessory -> Venus).
 *
 * The message 'AV_PROTOKOLL' may be used by an accessory to ask which
 * messages are supported. (This is different for Venus and GEMINI!)
 * It would be nice, if other programs would support the VA Protocol,
 * too!
 * The AV_SENDKEY [and ACC_KEY] messages are the only way to send
 * key-events to other applications - and these are easy to implement!
 * The VA_START message should be supported by all accessories, as
 * this is a simple method for applications to start accessories.
 *
 *
 * If a single-tasking TOS/AES is running (ap_count == 1) the accessory
 * should send a AV_PROTOKOLL message to application 0 when it is
 * started and each time it receives a AC_CLOSE message.
 *
 * If a multi-tasking AES is present (ap_count != 1) the main
application
 * is no longer guaranteed to have to id 0 and the AC_CLOSE messages are
 * send quite rarely. On the other hand it is possible for applications,
 * too, to communicate with GEMINI.
 * Therefore each application/accessory should try to find GEMINI using
 * the appl_find("GEMINI  ") system call. If this fails, it should look
 * for an application called "AVSERVER". Last it should check, if there
 * is an environment variable called "AVSERVER" and if this exists, it
 * should treat its contents as the name of the avserver-application.
 * Especially the last method gives an easy method to configure the
 * avserver.

Hi,

I work and program on Falcon 030, and I would like to have the Language (Assembler) documentation of the DSP56001. If anyone has it, please if you can, could you mail it to me , great thanks ! :=)))

bye and see you ..... Olivier

Is there a book, CD-ROM, or FTP document that has *detailed* info about programming a 100% compliant CPX, explaining what is needed to transform a small APP into a CPX that will work on every Atari from TOS 1.0 to 4.04, and specifying any un-documented calls that should be avoided?

The information source should be preferably in English, although, if all else fails, I understand French too.

Thanks to anyone who can provide me with any info about this ;-)

Umm...I'm not arguing with you here, but I was just curious...didn't
Dave Munsie use GFA Basic (M.A.G.E.) to make some of his arcade games?
They were pretty cool...

I've got some example code and docs. I dunno where I got it from but
if you want it email me. It's about 60k uncompressed.

Some people seem unable to grasp the concept of free and open debate. They cannot differentiate between criticizing an idea and a personal attack. The first would involve debating the validity of STOS as a game programming language, the second would involve personal attacks calling you a moron or worse! :-)

What I see here is an open, constructive debate on how and why various programming languages are good/bad for various applications. We can all benefit by finding out how others think, even if we don't agree with them.

Anyone not interested in this thread should merely skip it, not waste their time and yours emailing comments about public debates that they don't understand!

The basic concepts of C are universal, so why not get a book from your library or bookstore on C? Most are written for Dos, but I found that they get you started with basic C concepts and let you write TOS programs. You could then get the Progem series, which are free and at most Atari ftp sites. They are a series on gem programming that came out a few years ago, but still teach you the basics of windows, dialog boxes, etc.

No. You need to patch the entire OS to be able to do the same thing
/without/ using an ACC and without using a multitasker. Remember, there are
only 7 ACC slots available in SingleTOS; using an ACC for one file type (or
collection of types, in the case of N_PLAYER) means using resources that may
be desired for other things.

As it happens, N_PLAYER seems to to the job "properly" with CAB. I'd still like to see an OS extension allowing this type of thing from the desktop, though. Even just adding AV_START to singleTOS would be a big improvement.

I never really thought about it that much before. Maybe because I don't use a debugger, just the good old print statement. Now that I am thinking about it I guess the answer must be there isn't really a problem as I use MWC single tasking to run the command shell full screen or multitasking when I want it in a vt52 window, and both modes seem to work (or crash) the same with a development program.

Is there any particular area you were thinking about?

The only book info I've seen is in the Compendium. I've seen CPX
folders on the usual ftp sites - they might be worth a search.

You certainly do NOT need an "HTML authoring program." Even here with a
Pentium/100 I don't use the Netscaep editor - Wordpad is much faster and
it's easier to work with. Write the page, then look at it in your browser.

>I suggest you grab a HTML document to make yourself familiar with that
>language if you are using a normal editor. Just go to Yahoo & search "HTML"
>for where to get the online doc.

That's excellent advice. There are any number of search engines, as well -
and when you see an HTML effect that you want to emulate, view source and
copy it.

If one is writing the parser, one might be thoughtful enough to make it
case-insensitive, I should think. In fact, I usually convert the command$
to upper-case just to be certain.

There is an ongoing thread here that I find personally annoying, wherein a
couple of people (you know who you are, I don't intend to increase your
infamy) are bickering about which programming language is "best." As
someone who has dabbled in just about every language available (and a few no
one else seems to have ever heard of), here are my opinions - which are no
less valid, and no more valid, than anyone else's:

STOS is terrific for quick development of games running in ST Low
resolution.

HighSoft BASIC is terrific for manipulating text and managing the GEM
interface.

C (any flavor) is good for medium-sized programs which need more speed than BASIC can provide, but development time is extended.

Assembly is best when speed of operation is the only absolute essential; development time will be greatly extended.

Logo is interesting but not particularly productivity-oriented.

Pascal is a rather bad joke perpetrated by Nicklaus Wirth and UCSD. Great for teaching programming principles on paper, awful for actually programming.

SamllTalk is powerful and very confusing.

Ada is dangerous.

Forth is good for processing lists.

I've tried a few others that you won't have heard of; the upshot is, any programmer should use what HE feels is best for the application he's developing. Remember, the object is the deciding factor. If you want to develop something quickly, you should be using some variety of BASIC. If you want blazing speed, you should be using pure assembler. And if you don't know what you want, it doesn't matter what you use.

Force compilation to a GEM app - then it will not ask for the command line,
but will accept it if called from a program which provides that facility.

> how do i get a fileselector on screen, thats the biggy no one will
>answer ?????????

Ah. I'll have to consult my source codes - which are at home. Email me and
ask there.

You mean there isn't a command to do it? You could always use Gem's
fsel_input()! ;-)

A text editor gives you the best control and it isn't too hard to do.
I had my first page done before I even bothered to read any
instructions, simply by pinching bits out of other peoples pages!

Yes, it is possible. I cannot remember right now how, but I know that
this was asked (and answered :) in this group a little while ago...

Hi,

thanks to all who answered my questions. You all were a lot of help.
So that is how I got it working by now:

Get the TOS image (I now try 2.6) and name it "Magic_pc.os" and let
gemualtor find it. That's all.

The file selectors now work fine. Speed is amazing.

Just two little problems are left:

1) The TOS I got is in english. But I need the Umlautes "????" and so
on. Does anybody have access to a german TOS version?

2) Funny enough I can read all files from all partitions but GfA will
not detect the EOF. This problem appears ONLY with files imported from
the original ST. When I create the files with the gemulator it works
fine. Maybe I need ti add a (DOS?) EOF character myself. Any ideas?

But thanx anyway for all your help

Ronald

ps: One thing I noticed was that the gemulator won't start up properly
when the printer is absent. Maybe that's a feature and no bug. I still
wonder what this black bar means which continues to get smaller during
boot up of TOS 2.6.

If this is the reception a game programmer gets for producing a FREE game for a dying platform... I would certainly think twice about producing any more for that platform!

Lighten up you guys... at least he is trying to inject some life in the Atari.

Just my 2 cents.

Regards
William

You don't need ST-Guide... what you need is just a normal editor. Of course
you will not see the graphics in the editor. For those, you need a HTML
authoring program, AFAIK, Atari don't have one.

I suggest you grab a HTML document to make yourself familiar with that
language if you are using a normal editor. Just go to Yahoo & search "HTML"
for where to get the online doc.

Regard
William

One of the two, or both, input values for evnt_button with the bitmaps for
left and right button should be ORed with the values 0x100.

I can't remember if both values should be ORed, or only one. Anyone else know, or you'll have to try! :)

Hmm... CAB is written in Pascal! Personally I like pascal, especially
the "object-oriented" varieties. Delphi 2 is actually very cool!

>SamllTalk is powerful and very confusing.

I don't know about "powerful", but it sure is confusing!

>I've tried a few others that you won't have heard of; the upshot is, any

Agree, except for the BASIC-part. IMHO (Yeah right!) basic (I'm
talking about the "classic" basic here.) is totally useless. But if
people like it, let them use it...

On Mon, 25 Nov 96 14:33:47 GMT, in comp.sys.atari.programmer you
wrote:

 haaa new blood to the thread...yummy :)

>There is an ongoing thread here that I find personally annoying, wherein a
>couple of people (you know who you are, I don't intend to increase your
>infamy) are bickering about which programming language is "best." As

1) Eeeerm actualy thats not the case and not the thread, they all left
with there tails between there legs, on an eternal search for a gem
game made in BASIC, so they wont be back for quite a while
heheheh

>STOS is terrific for quick development of games running in ST Low
>resolution.

Ho no not another?. you suprise me Rich?

 BTW whats this "quick", you think H.E.R.O. was a quicky maybe ?

 Diskzine construction Kit (Show me better in any language) used by 5 current live uk diskzines and has been used by many more one offs in the past, as you can imagine, medium rez, allows you to cut and paste pictures into your scrolling text....and this is pre-cab etc?

Multimedia display, runs entirely in medium rez and allows you to make one (packed) document that contains its own, music, sampled sound, animations, colourd text, various fonts, it not only has its own individual editors for these options but is also the player, everything runs in medium rez and will work on a bog standard 1 meg FM, the total file size for ALL this program is 75k

SHOWTIME uses a medium rez shell to search you directory, and inside folders to find an array of different format of picture files, the shows then in a slideshow fashion, but in full overscan by first stretching the picture then removing all four borders,

TEXTY....eerm hang about..theres a lot more none games serious and novelty? programs in medium rez and in STOS...should I go on?

 Sorry Rich, but your comments go a long way to suggest that you are not talking about the STOS that is available to the programmer today, when did you last make a game in STOS, was it upgraded STOS, if not then you are making comments on a language that is no longer really used, there are so many new commands, I can't even remember most of the original STOS ones,

>HighSoft BASIC is terrific for manipulating text and managing the GEM
>interface.

 I can imagine and would not dream of saying otherwise,

>C (any flavor) is good for medium-sized programs which need more speed than
>BASIC can provide, but development time is extended.

Again , I would not dispute this, although the last two comments have nothing to do with the thread, I would still agree :)

>Assembly is best when speed of operation is the only absolute essential;
>development time will be greatly extended.

 Yet another that has nothing to do with the thread, maybe thisa would be a good time to say

 I think STOS BASIC is the best BASIC available in 1996 for making

games, and I will go as far as to add C to the whatsit,

>Logo is interesting but not particularly productivity-oriented.

 again I agree,

>Pascal is a rather bad joke perpetrated by Nicklaus Wirth and UCSD. Great
>for teaching programming principles on paper, awful for actually
>programming.

 HO SHIT!!! I just ordered Personal Pascal :(.....I did!

>SamllTalk is powerful and very confusing.

 Never heard of it?

>Ada is dangerous.

 She is ??

>Forth is good for processing lists.

 Ok..

>I've tried a few others that you won't have heard of; the upshot is, any
>programmer should use what HE feels is best for the application he's

 yes yes, that all goes without saying, but really? what does it have
to do with the debate of the best BASIC for making a game in 1996,

 Yet another none beleiver enters the thread ,

 STOS has been upgraded, I made a statement, I expressed an opinion,
someone should have come along and said, hey not its not, look at
this, this is better, but instead everyone talks about anything but!

 Its not enough to tell me how bad STOS is, someone has to show me
better, in BASIC or C, if people come into the thread saying I am
wrong, but show me nothing more than talk and hot air, then I must
reply and defend my original statement, surely the people entering the
thread with nonsense should be chastised for wasting everyones time,

 Is anyone willing to dispute my statement wihtout mentiong assembler,
macs, and all manner of things that have nothing to do with the
thread?

ta!

 PS.....You wasnt expecting anything less than the above was you Rich
<big smile>

Cheers.....!ynoT

Why don't you make the code accessible so that other people who is interested
can take a look at it, even may implement something...

Here is what I normally do for web pages, I used the Netscape editor to create
a template - with all the tables, graphics position as I can see where they
all go in the page. After that I use a text editor for subsequent changes,
much easier. Downside is that you must know the language!

Right...

And that poor guy started off by giving out a FREE software for the ever
decreasing pool of new software for the Atari. Why bother doing a program for
a bunch of people who instead of giving you a pad on the back, criticize you
and the program.

Worst, they are critcizing the tool which is being used.

Just my 2 cents.

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WEALTH!

Hello!!

Would you like to make thousands of dollars, quickly, legally, with NO CATCH? Then keep reading.....please take five minutes to read this article- it will change your life, just like it did mine. It's true! you can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize for wasting your time.

Here we go, A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks, with only an initial investment of $5! So, I thought, "Yeah, right, must be a scam".

but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1 to each of the 5 names and addresses stated in the article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200

newsgroups (there are thousands). No catch, that was it!

So after thinking it over, talking to a few people first, I tried it. I figured what have I got to lose except for 5 stamps and $5, right? Well, guess what....within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept coming IN, tripling in size and multiplying by 10-20 times the amount that I got the first week! In my first week I made about 2- to 30 dollars. But by the end of the second week, I had made a total of over $1,000!!!!!! In the third week, I had over $10,000 dollars, and it's still growing! This is my fourth week (Nov 13) and I've made about $42,000 TOTAL, and believe it or not the money is still coming in.....

Let me tell you how this works and most importantly, WHY it works...also, make sure you print a copy of this article NOW so you get the information from it, and begin making money.

The Process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 seperate pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST". YOU ARE NUMBER 4. get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, EACH having a piece of paper and the $1 bill inside. NOTE: make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this.

This is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses.

1. Bruce, P.I. Box 63 4700 Keele St., North York, Ontario M3J 1P3

2. Lars Westin Bj[illegible]rkv[illegible]gen 3 740 12 Knutby SWEDEN

3. D. Hill, 4280 150 6 Ave. S.W., Calgery, AB, Canada T2P 3Y7

4. Mattias W sernanders v[illegible]g 1 rum 535 752 61 Uppsala Sweden

5. Jeff Boldrick, RR#2 Tweed, Ontario K0K3J0

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, etc.) editing what you need to edit.

STEP 3: Post your amended article (with your name at #5) to at least 200 news groups (there are around 10,000 of them!!). All you need is say, at least 200. HOW TO DO THIS: If you have netscape 3.0 do EXACTLY the following:

1) click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box as it is, but CHANGE the subject box to somehting eye-catching, like, "NEED CASH $$$ READ HERE" $$$ or "FAST CASH" !!!

3) Tab once and you should be ready to type. Now, Copy and paste or retype (only once)

THIS WHOLE ARTICLE, word for word, except to insert your name at #5, and to remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the same.

4) When you're done typing(Copy/Paste) the whole article, click on FILE in THIS BOX,

right above send, NOT where it says netscape news on the first box. Click on SAVE AS when you're under FILE. Save your article as a Text file to our c: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTILL YOU HAVE SAVED IT. Once saved, move on to number 5 below.

5) If you still have all of our text. send or post to this newsgroup now by simply clicking send, which is right below AFILE, and right above the Cc: button.

6) Here's where you're going to post all 200. OK, click on any newsgroups then click on 'TO NEWS', again (in the top left hand corner of your netscape navigator. Leave the newsgroups box alone again, put your eye-catching title in the SUBJECT BOX, hit tab once you're in the body of the message, and then click on ATTACHMENT, which is below the subject box. You will get another box to come up. Click on ATTACH FILE, then find YOUR FILE THAT YOU HAVE SAVED; click once on this file, and then click OPEN. NOw click on OK. If you did this right, you should see our file name in the attachments box, and it will be shaded green.

IF YOU USE I.E EXPLORER, IT'S JUST AS EASY: Holding down the left mouse button, highlight this article. Then press the "CTRL" key and the "C" key at the same, to copy this article. Then print this article for your records to have the names of those you will be sending $1 bills to. Next, go to the news groups and press "POST AN ARTICLE". A window will open. Type in your headlines in the subject area and then click in the large windows below. If you want to edit the article, do so and then highlight and copy it again. Now everytime you post the article in a newsgroup all you have to reat is "CTRL" and "V" and press POST.

7) That's it! Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups. You See? Now you just have 100 to go!! (Don't worry, each one takes about 30 seconds, once you get used to it). REMEMBER, 200 IS THE MINIMUM. The more you post, the more money you will make.

You are now in the mail-order business and will start receivng your $1 enveloopes from various people all over the world, within days! HINT: THE MORE NEWSGROUPS YOU POST TOK THE MORE MONEY YOU WILL MAKE.

You may want to rent a PO Box eventualy, because of all the mail. If you wish to stay anonymouse, you can come up with a name, such as "manager" or " investor". Just make sure all the address that you have typed in for the 4 people plus yourself are correct, please.

LET ME TELL YOU WHY THIS SYSTEM WORKS!

Out of every 200 posting, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my name at #5. Now, each person who just sent me $1 makes, say, only 200 posting, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. So people send you $1 now-that's $50 you have just made! Next, your new 50 agens each post 200 newsgroups with your name at number #3, or 10,000 POSTINGS (50x200 = 10,000). The average return is 500 at $1 each, so $500. They make 200 postings, which is 5,000 returns at $1 each, which is $5,000 dollars! and finally, 5,000 people make 200 postings with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000 BEFROE YOUR NAME DROPS OFF THE LIST. AND THAT'S IF EVERYONE ONLY MAKES 200 POSTINGS, AND IF ONLY 5 PEOPLE RESPOND!!!!!!

When your name is no longer on the list, you simply take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5 TO

THE NAMES ON THE LIST. PUTTING YOUR NAME AT #5 AGAIN. And start posting again. The thing to remember is, THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND READING THESE ARTICLES EVERY DAY-just like you are right now!!!

So can you aford $5 to see if it really works? I think so.....

People have said, "What if the plan is played out and no one sends you the money?"

So what! What are the chances of that happening when there are TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE who are joining the internet and newsgroups every day and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day with THOUSANDS of those actually joining the internet.

Remember, PLAY FAIRLY, AND HONESTLY, and this WILL WORK, I promise you!!!! You just to be honest. Make sure yhou print this article RIGHT NOW.

Also, try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

REMEMBER: HONESTY IS THE BEST POLICY! You don't need to cheat the back idea is to make money!

GOOD LUCK TO ALL PLEASE PLAY FAIRLY, AND YOU WILL REAP THE HUGE REWARDS FROM THIS-TONS OF EXTRA CASH!!!!

One last note: If you try to deceive people by posting the messages with your name on the list and not sending the money to the poeple already on the list you won't get much.

Someone I talked to knew someone who did that and he only made $150

dollars, and that's after seven or eight weeks! Then he sent the 5 $1

bills, people added his to their list, and in 4-5 weeks he had over

$10,000!!!

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE

WEALTH OF THE WORLD WITHOUT COSTING US ANYTHING BUT OUR TIME, $5 AND

FIVE POSTAGE STAMPS!

Thanks for taking the time to read this message! This is about a lady
that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I□m not the only one that thinks that way either. It wasn□t just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can□t be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I□m 26 now and many of the things I□m telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say □You can do it... It□ll be okay.□ I□ve never been able to make a good attempt at trying to repay her for all she□s done for me and I□m not alone. Many people just have taken for granted the things she□s done for them.

I know by now you□re asking yourself why I□ve posted this letter. Well, to be honest and straight with you it□s because I would like your help. If there□s one thing that I□ve learned from Wendy it□s that, □We are our neighbors keepers.□ You know the golden rule, □Do onto others as you would have them do onto you.□ Anyway now Wendy is an older lady that is disabled and can□t do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can□t be of much help. With no real family I□d like to do something to try to repay all she done for me and many others.

That□s were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it□s someone you can□t even remember or have lost touch with. For that moment picture Wendy and say, □I□d like to repay that kindness.□ I wish you would sit down and write a small note saying □Thanks for being the generous person that you have been!□ If you could include something to help out. Maybe it□s a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin sends his love. Her birthday is next month on the 27th and I□m hoping I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

Wendy Mcghee

Well, if you had a DA which understood AV_START and simply played a the sample,
this would work from within CAB. No problems. *Should* not cause CAB to redraw.

However, from Desktop, this is not the case, as it doesn't understand the AV
protocol. Thing on the other hand...

>clicking a WAV link leads to a complete redraw of the page after SWAV plays
>the sound.

This could be CAB's fault. There are definately some redundant redraws there...
I have never tried running an AV_START wav/avr player from CAB, but there should
be no reason why CAB needs to redraw the screen.

That is wierd! Maybe it has something to do with the PC's partition that
Gemulator uses that are different from the ST's. I don't know exactly how GFA
detects EOF, but it may be flawed, which is causing your problem.

I guess you can do one of two thing:
  1) Use a virtual hard disk image. (I don't know if the Gemulator Demo
     supports this, but I think it does.
  2) Read in and re-write the files under GFA Basic to fix that problem.

> I still

It's a memory test, you can hit the spacebar to quit it.

>
>believe it or not the money is still coming in.....

Lets see, $32,000 in $1 bills in one week. That amounts to 32,000 letters. Since the post office does not deliver on Sundays, that means you received an average of 5,333 letters per day. If you sleep for eight hours a day, and spend the rest of it opening 5,333 letters, you would have to open one letter approximately every 11 seconds all day long without rest or food. You won't even have time to pay your bills or do other household chores. You'll also need to rent a truck to drive all that money to the bank and pick up your next load of mail because it will weigh about a ton. That means you'll need to cut into your sleep time and/or open the mail faster.

This is beside the fact that the bank, police, FBI, and the IRS will become very inquisitive over your repeated large cash deposits. Your home will probably be raided once or twice if not outright seized for probable cause of drug trafficing, money laundering/counterfitting, etc. The postmaster general will be after you to explain why you're suddenly getting so much mail. Somebody at the post office will go 'postal' because of the sudden manditory overtime to sort mail. The garbage collectors will fine you for exceeding your weekly garbage limit, and much of it will remain on your lawn since they can't haul it all away. That means the city will be after you as well because of all the trash in your yard (not to mension that it hasn't been mowed in some time since you've been busy opening 5,333 letter a day). BTW, doesn't your finger get a bit sore and don't the papercuts hurt?

It goes without saying though, if you spam your message to 200 newsgroups, and only 15 people are dumb enough to respond and spam out another 200 messages per person, you will have ran out of news groups to continue the chain in. This is because there are only 3-4,000 newsgroups, not 10,000, and only about half of those see a significant amount of activity. Max profit for you is $15 income - $7 (investment + stamps/envelopes) = $8 net. Wow.

Your story is just a weeeeeee bit far fetched.

Sure. It waits until a button event occurs where
  (button & bmask) == bstate
so set
  bmask = bstate = 0;

It will then return on ANY button event. (Just ignore it if both
buttons are down.)

 what do you mean "classic" BASIC? , and why do you say totally
useless, are you telling me that in ALL the time you have used
computers, from the very first day you set eyes on one, you have never
used a program written in BASIC?, maybe you used plenty but just did
not know it?,
 I would say that posting a message in a programming newsgroup saying
BASIC is useless, when you have used software written in it, wether
knowingly or unwittingly, is a very sad case of using your gob when
your brain is dissengaged,

: clicking a WAV link leads to a complete redraw of the page after SWAV plays
: the sound.

Ah, yes, but when using CAB you could call the forementioned hypothetical
accessory directly from CAB (CAB has AV capabilities, doesn't it?),
you wouldn't have to _start_ anything, so CAB just goes on running.
You just need a manager app of some sort to call the acc from the desktop,
as a "viewer". This manager would only have to pass the filename to the acc,
just as CAB would have to do...

And you should know as we use it in GEM-DEU! :-)

Just check in deu.c and the evnt_multi call.

>find it...

Further tests gave a stunning result:
When I use the "Ataris-ST" drive mode so that all files are put into a
container, it works perfectly. Having a close look onto the files had
no result. I tried adding some characters, but it look slike gemulator

(or gfa basic) never ever recognizes the EOF of files which are among
dos files.

Just for info

 Whoops, I missed a lot of this, but presume you are talking
emulators, and your keyboard works as English but you want German?

 Well I had the opposite problem, when trying to type, I was getting
the German keyboard when I wanted English,

 A small AUTO Folder program cured this, theres also a keyboard
manager cpx that lets you choose the keyboard language type thing and
set the keys,
 I cant go into it too technically because I do not understand it, I
just know it works and offers a variety of languages,

CKBD is the name and found on most ftp sites,

HTH and if it doesent, then apologies for getting hold of the wrong
end of the stick..as they say :)

hehehehe.... Yea, but I dont keep the GEM-DEU source here at uni. :-)

Actually, now I think about it, I do! In my WWW pages, of course! Doh!

right, here it is...

```
        event = evnt_multi(MU_KEYBD | MU_BUTTON | MU_MESAG,
                  0x102,3,0,
                  0,0,0,0,0,
                  0,0,0,0,0,
                  msgbuf,0,0,
                  &PointerX,&PointerY,&mousebut,&kbstate,&key,&numclicks);
```

Its the 0x102 which does it I think - setting the 0x10? flag makes and the
value of 3 is the important bit. (we are also detecting doubclicks)

Doh! how did I forget that... :)

Anthony

I know of a much more honest way to share the wealth... GET A
JOB!!! Sure you will end up paying some money to the
government, but look at all the wonderful services you get in
return!! And you will feel much better about yourself because
you won't be stuck behind a computer posting to 200 newsgroups!
You may even make a friend or 2!

As for an article changing your life... try giving a read to

the following -
http://www.gospelcom.net/rbc/salvation/index.html

It will take you a lot further and doesn't cost you $5.00

Ah, that explains why it is so slow and buggy! ;-)

Where I used to work, the first (and last) time they tried to use
Pascal they had to go back and redo the whole project in another
language in order to get reasonable performance out of it.

>and the program.

 <smile> I probably brought a lot of it on myself for starting the
thread, making a statement (that as yet no one has proved wrong<G>),
but I have to admit I did not see the point in ripping my programs
apart, when the way to handle the debate would have been to show me
better?, I honestly was not trying to say my programs where the best,
but to find out if anyone thought there was a better BASIC for making
games,
 The thread got on some peoples nerves, although I dont see why,
theres a long and boring thread about mutitasking in c.s.a.st but I
suppose thats alright :)
 Anyway after trying unsuccesfully to do whatever they where trying,
they have all gone off in a sulk, we can now safely say the thread is
dead if thats what everyone wants, and we will all just have to agree
that STOS is the best BASIC for making games in 1996 hehehehe

>Worst, they are critcizing the tool which is being used.

 And they realy should have known better hehehehe

>Just my 2 cents.

 Appreciated :)

Released this weekend, DIAMOND-ICE, already quoted as being ten times better than Heartland :)

Cheers.....!ynoT

hehe! It's not _that_ bad because they all come with extensions to the standard. Pascal was my first compiled language and I think traces of it can still be seen in my C today. I'm not a fan of incomprehensible rubbish when comprehensible rubbish will do!

>>Ada is dangerous.
>
> She is ??

Oh most certainly she is, yes. My "two lift" problem got sorted in assembler quicker than in ada. ;-) It's a language that incorporates multitasking constructs btw.

Too true, especially "standard Pascal". I have heard good things about
oops pascal (delphi?), though not had the opportunity to try it.

No, it's the result of some saying his programming language is the best for games and two very stubborn people discussing the subject.

> Lighten up you guys... at least he is trying to inject some life in the
> Atari.
> Just my 2 cents.

And we are generating a lot of attention to his games and programming language. I am sure serveral people have downloaded the game to look what all that noise is about.

Hi, does the T-28 board switch back correctly to 8 MHz? My Turbo 20 board (very old product) doesn't swith back it's memory acces timing correctly. Memory acces is always like the shiffter is accessing video memory, even when it doesn't. This gives trouble with very tight timed programs like fullscreens demo's.

>  I   I   I     <---- raster width
>
```

Yes, this fix is also simple. Move the character about 6 pixels to the left and all is symetric again. The trouble is that the left hand of the character is algined with the raster and the character with is not a integer number times the raster width, causing a misalignment of the symetry axis of the character and (raster width)/2. However, moving the character about 6 pixels to the left will make the cahacter witdh 3 times the rasterwidth instead of two.

Ok, that's the way dat can be included into programs, you answered a question of mine before I could ask it, thank you.

> Reserve as screen = temporary screen
> reserve as work = temporary work area
>
> Then I can also reserve as music, charactor set, 3d, sprite
> and stos will know exactly what to do with them, it will allways know
> there start address and size and whatever

What is the difference between al those reserve commands? IMHO memory is memory. I don't see the need telling to computer for what purpose memory is reserved. The special thing about screen memory is that is has to be aligned on 256 byte boundaries, but I was told all memory blocks are reserved on 256 byte boundaries. Why differentiating in all those types?

>> think so. Does STOS automaticly alaign memory banks to 256 bytes
>> offsets so
>
> yes....so there!

OK, that's clear.

```
>> Scr=memory(64256)            ' Get some memory
>> scr+=256                     ' anticipate round down
>> scr=scr and $ffff00          ' get 256 byte boundary
>>
>> and thats the same as reserve as work 7,64256 hmmmmmmm?
```

```
 >>
 >> No, only the first line is. The second and third line are to make sure
 >> my screens adress will be aligned to a 256 byte boundary.
 >
 > then IT IS THE SAME as all I need to do is reserve the bank and STOS
 > does the rest....why didnt you beleive me?
```

Because it's unusual behavior for a memory allocationg command. Normally they alaing to 2 or 4 byte boundaries.

```
 >> repeat
 >> scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate
 >> videobase lpoke $ff8200,scrp         ' poke directly into hardware
 >> register wvbl                       ' wait for vbl
 >> scr+=1280                  ' change offset
 >> until(0)
 >>
 >> Mine is faster. And speed is al you need to get good arcade games.
 >
 > really, how the heck do you know ?????????????
```

Because every screensetting command has to do something like this. Calling a subroutine that calls an xbios command will be slower.

```
 > I reserve all my banks and the rest in a routine called SETUP , the
 > main loop that uses speed will not have any memory being reseved etc,
 > you dont need that extra kick of speed until the main loop
```

I am not talking about the speed of memory allocation. I was talking about the speed of switching screens. You can use the fast way too in STOS. You have to be in supervisor mode, that's is no problem because heartland is working in supervisor mode so you either switched to supervisor mode, or STOS is always in supervisor mode. Yes, some poking has to be done, but poke is also a regular basic command, and it is faster, so why not use it?

```
 >> STOS will, but does the hardware know? Does STOS start to move around
 >> banks in
 >
 > yawn...how many times?
```

Well, as you don't have trouble my guess is STOS doesn't move it's memory banks when surrounding memoryblocks are released. Can someone confirm this?

```
 >> As you told me I don't no how to program STOS, so I don't know how
 >> your memset command is called. (Probably it depends on which extension
 >> you use).
 >
 > Extensions are upgrades to STOS programming launguage , just like any
 > other language gets upgraded, waddaya mean it depends on which
 > extension? stop being a baby,
```

I guess there are a lot of extensions you can use for a lot of different things. So it's resonable to think there is more than one extension that

supplies you with a command to set a block of memory to a cetain value. Maybe there are commands that lets you set memoryblocks with a 2, 4, 8 or 16 byte value. You have to be able to differentiate between the commands in different extensions. So how is this done? How are new commands added to STOS? How do I make sure the command name is already in use by someone else?

> Well you got that right!...I had absoloutly no idea what your list of
> pokes where meant to do, we are using diferent BASICs, STOS the
> upgraded 1996 BASIC, and your old one that would seem to rely on
> being poked to death?

Please, I explained you why I was using pokes: I don't know the memset() command in STOS, so I used pokes because that command is supported in all basics.

> so your long list of peeks etc that resembled an old spectrum listing
> is just a round about and confusing way of :.....
>
> reserve as (whatever type or size bank i want)
> reserve as
> reserve as :rem 3 banks
> fill start(?) to length(?), 0...or f or whatever

Yes.

> Ok i will leave this thread with pleasure, you can stay in it and
> talk to yourself until you actually win a debate, probably take you
> ages hehehe

I am not trying to win a debate in this thread. I am just curious about a programming language that I don't know. I'd like to know how certain commands work. I like to know how things work.

What happends when you are tying te reserve memory when no memory is left? (C returns a NULL pointer, Omikron basic generates an 'Out of memory error.)

```

Hi, I know that you can boot Magic PC with any OS image in the range TOS 1.00 to 2.06. There are even two different ways to do it:

Replace the file MagiC_PC.OS with the TOS image you want to boot from

or

Insert the TOS image you want to boot from as the file ROM.OS. When booting Magic PC it first looks for the file ROM.OS and when found it will boot from it. When ROM.OS is not available it will look for the file MagiC_PS.OS and use that one to boot.

Maybe you can test the resolution in your next game and print a message saying the game only works in ST LOW instead of locking up the system?

> dispute its there or question your comments, either of you, juts
> simply to say, cannot see it ?

Did you check the archive? It might be a broken file in the archive.

> see your point? none of the words you mention have any relevance in
> STOS BASIC, they are not STOS BASIC commands and as far as I am ware
> are not mentioned in the STOS BASIC user manual?

No, but they are mentioned in every ST programers manual. You can use the bios and xbios functions with STOS, so see them as etensions to the language.

>> Most of them have extended graphic hardware, the only access to
>> screen is VDI! STOS does not make use of VDI, it writes its drawings
>> direct into memory. This is fast, but will only work on original
>> ATARIs (ST/STe/TT/FALCON without extensions).
>
> without extensions? what on earth does that mean ?

He means extensions like videocards, turbocards, exotic memory cards and all other thing you can add to a normal ST, so an Atari without extensions is an Atari like you have, no modifications.

> the thread is best BASIC for games ??????? why do people have to
> start prattling on about applications and anything else they can
> think of because they are too scared to admit they cannot fault my
> original statement,

We said your original statement was false because STOS can't do GEM games. You said no one wants GEM games because you think they are slow and nonresponsive (just like we thought about STOS). We are proving there are lots of people wating GEM games. Try to get a copy of Kubis '96 or WinColTris to see a mordern GEM game.

> Ok I never said my games where fanatastic, I said STOS is the best
> BASIC for making games on the ATARI in 1996,
IF you don't want to make GEM games and don't care about the fact the game doesn't run on a TT and the game will only run on a Falcon using backwards.

>> There is no choice between GEM games and none GEM games, because you
>> can only run GEM games on the new powerfull atari compatible

Do a Web search for WAVEPLAY - that's where I found it. John Curtis added a GEM front end to it and compiled it to WAVPLAY2 (look at my ftp site), but it doesn't do stereo. Otherwise, it seems to be just about he best WAV code there is. Ned's Player has a better interface, though, and many more file types.

If it's not "quick" (as compared to C, Assembler, Pascal, or whatever), then there's no reason to use BASIC in any flavor. AFAIAC, the whole point is writing a program in a language that actually makes sense to me days later., so that I can figure out without running a half-dozen debuggers/system monitors what's wrong, make the (hopefully minor) changes, recompile, and re-test it in a few minutes.

And it's still advocacy.

I used BASIC in various incarnations from 1984 to 1992, including STOS. I wrote some programs too (A diskzine-shell, a couple of demos and some programming-utilities.) in STOS and at that time I liked it. The reason I abandonded STOS was that it couldn't do what I wanted it to without some serious hacking. And I'm not talking about sprites and stuff here, I wrote those parts in assembler anyway (This was before all those cool extensions.).

I'm a fan of clean and structured programming; no way you can accomplish that with STOS. I mean, just look at those line-numbers! Show me a 10000-line *structured*, easy-to-read source in STOS! Let's face it, the programming-language itself is crap. No procedures, no functions and no dynamic datastructures (No datastructures at all except for arrays.). (BTW. this is what I mean with "classic BASIC".) If STOS had looked anything like AMOS on the Amiga (It was awesome!) we wouldn't have this thread today.

> I would say that posting a message in a programming newsgroup saying

>BASIC is useless, when you have used software written in it, wether
>knowingly or unwittingly, is a very sad case of using your gob when
>your brain is dissengaged,

Perhaps you should try looking outside the (very) small world of BASIC
and see what else is out there. You're obviously a very skilled
programmer (I've seen a couple of your games and they were cool!),
if you spent some time learning a more powerful language you could
write better games in the same or less amount of time you use now.

The time you save by being able to write one line of code instead of
three to plot a sprite is quickly consumed by the additional time you
use to maintain large sources with line numbers, goto's and gosub's.

Your original posting said something like "STOS is the best BASIC to
write games with", and that's correct. But you included C too, which
is more powerful than STOS no matter what you say. You claim that you
write your games in ("Upgraded") STOS. OK, if I wrote a library like
"Missing Link" for C, could I write a game with it and claim that I
use nothing but "upgraded C"? I couldn't, 'cause I used C and an
additional library, just like your extensions. They're not a part of
the language, and no sane person would say that the language BASIC is
more powerful than C??

Well, actually, the first bar is a memory test. The second bar is a built in delay to allow older hard drives to come up to speed before continuing the boot-up process...In any case, he is right--just bash a key to carry on... :)

I own many games written in 1990 and earlier, and they run from HD and
makes no trouble with my T-28. On the contrary, they peform much better
with 28 MHz. (Civilization, Elite II Frontier, Transarctica, Power Monger,
Popolus, Ishar)
Of course there is another diference to yours, these are not free games.

I translate it as:

"Don't start STOS games on new atari's because they will crash!"

Using your words: "The thread is best BASIC for games"

Can a Programming Language be the best of all, if the resulting program
won't run on new ataris? Hhmmm....

I just started Heartland 5 times, I can see the bugs every time!

MEGA ST 1 (4MB RAM), TOS 1.04, 8 MHz, ST low, blitter disabled, HD enabled,
all hardware extensions disabled.

>
>>I want to know what video hardware is present.

cause incompatibilities in software that relies on hardware access rather than the recommended method of using standardized OS calls.

The recent availability of these computers as well as enhanced graphics and peripheral boards amphasizes the value of programming using the OS whenever possible to allow software to be run on the widest variety of machine configurations.

---------4.3 XBIOS - Overview -------------------
...
Some functions (notably video hardware and storage device related functions) should only be used by device drivers and system level software as they represent a non-portable method of hardware interaction which may be unsupported in future Atari computers.

As a general rule, GEMDOS and VDI functions should be used, when possible, rather than XBIOS calls. The GEMDOS and VDI provide a software abstraction layer which will make software applications much more compatible across new computer releases.

>
> NO ONE has done anything to prove otherwise, you have all TALKED
>TALKED TALKED

Maybe STOS is indeed the best BASIC for making games for the atari _ST_, but there are a lot of other ataris. (Which are not or not full supported.) And that is the bad part of your STOS games.

> None of you can show me a game written in BASIC thats better than
>STOS ones, it is childish to start trying to find bad things in my
>games, show me something better, thats the whole point, or dont you
>all understand ?????

OK. I will write a game. It will support extended resolutions.
Can you beat this special feature with STOS?

>>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
>>Hades 060 is more than 20 times faster than a 8 MHz ST.
>
> and your point is what ??? would it have anything to do with making
>games in BASIC, I think not :(

A faster CPU can compensate slow code. GEM code is mostly slow code.
To make good GEM games, you can compensate the slow but compatible
GEM code with a faster CPU.

>>There is no choice between GEM games and none GEM games, because you can
>>only run GEM games on the new powerfull atari compatible computers!
>
> really? I think you will find you are WRONG

OK. So tell me some STOS games that will run on my ST at its extended resolutions or on the mentioned Perfoma 460 (832x624x256). I've tested many GEM games successfully.

>>Tony: Why do you dislike GEM? Have you ever worked on a "big" atari?

That's overhelming! You can code without any monitor! ;)

>I manage to make reasonably good
>software thats quite well recieved in the ATARI community, beleive me
>its not that easy with such a bare minimum set up,

Serious: Compliment to you.

> SO no i havent "worked" on a big atari, in my book this is big:)

Indeed, it is. I hope you can use some time a big atari, to make very good games.

> why do all gem programmers think there is only red,green white and
>black, surely they can change the colours here and there,

Most of them have a monochrome monitor.

>I have made
>some serious software in medium rez, and they "look" quite nice, I
>made angled scroll bars with shape and depth, 3d boxes etc,
> Nagggh I definatly dont like GEM its boring IMHO:)

How look your colored software at a monochrome resolution like ST high?

You've asked for the best BASIC for making games in 1996, so please refer to a GEM of 1996. The actual GEM offers you much more than scroll bars with shape and depth or 3d boxes. The GEM of your 1040 STe is from 1990!

>
>>BTW: Is there any (GEM) monopoly game around?
>>   In case there's no one, I'm forced to write my own...
>
> in BASIC ? :)

In C. I have no BASIC which is 100% GEM compatible.

 Something like that..If you have the ability to run the game by
booting some other way, then why boot in the way that makes it crash,

seems a bit silly to me?

>Using your words: "The thread is best BASIC for games"

>Can a Programming Language be the best of all, if the resulting program
>won't run on new ataris? Hhmmm....

 YES, when there is nothing better about?, a game made in BASIC that
works on most ATARIs is better than a none existant game, how many
ATARIs will that work on, no game=no ATARI's...yes?

>>dispute its there or question your comments, either of you, juts
>>simply to say, cannot see it ?
>
>I just started Heartland 5 times, I can see the bugs every time!

 As the program is pure code, and all the data is on disk, dare I
suggest the zip might have been damaged, or....maybe your display is
far superior to mine?

>> I have commands to not only find the current resolution, hertz rate

 You see I am talking about the majority, are you seriously trying to
tell me you do not have access to ATARI ST low rez, if you have, then
whats the problem ?

>>>Your wonderfull STOS games are not running on this nice big ataris!
>>
>> hang about, whats all this "your wonderfull stos", if you are trying

>>
>>>Most of them have extended graphic hardware, the only access to screen

 But also have the ability to use ATARI ST low, so ????

>To be on topic:
>
>The only way to display anything on these graphic extensions is VDI/GEM.
>And STOS is not able to use VDI AVAIK.

But why would I want to use those resolutions, If you have access to st low, and if you havent? then you show me a game made in basic that is using them that was programmed in 1996, and will work in atari low as well ?

>> NO ONE has done anything to prove otherwise, you have all TALKED
>>TALKED TALKED
>
>Maybe STOS is indeed the best BASIC for making games for the atari _ST_,
>but there are a lot of other ataris. (Which are not or not full supported.)
>And that is the bad part of your STOS games.

nooo you are missing the point and straying from the whole thread, it is not good enough to tell me how bad stos is, it is pointless telling me the flaws of which I am already aware, there is certainly nothing to be gained from publicly attacking my software,
for my statement to be wrong, you have to show me better ? but you cannot, so even though STOS does addmitedly have drawbacks, and STOS may not be the best all round BASIC for the ATARI and my games may not be the best in town, until you show me better, written in BASIC in 1996, then my statement is proven to be true?

>OK. I will write a game. It will support extended resolutions.
>Can you beat this special feature with STOS?

I am sorry, but I do not believe you will write a game that will work on every single ATARI, including my humble setup and your highest spec, and someone, anyone say, hey what a good game, and be in BASIC only,
I am not saying you are not capable, I presume you are, you probably have the ability and the software to make something spectacular, I am saying that i doubt you will, and would go so far as to say I am absoloutly sure you wont be able to make one that will prove my original statement wrong :) hehehe, you may want to recap the original statement before you start, a quick glance at the calander would suggest you only have a matter of weeks to do it in, <smile>

>>>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a

 doh!...whoops :)

>> SO no i havent "worked" on a big atari, in my book this is big:)

>Indeed, it is. I hope you can use some time a big atari, to make
>very good games.

 well I think you stated a falcon is not big in your eyes, but that is
something I would like to do, hopefully this does not sound big
head'd, but I really do believe I could make some really good software
on a falcon, most of the commands I have available now have already
been converted to work on the falcon, STOS on the falcon will access
most of what it has to offer, all that speed, true colur sprites d..
ho there i go again, drooling...it may never happpen though :(

>> why do all gem programmers think there is only red,green white and
>>black, surely they can change the colours here and there,

>Most of them have a monochrome monitor.

 haaa, fair comment :)

>>made angled scroll bars with shape and depth, 3d boxes etc,
>> Nagggh I definatly dont like GEM its boring IMHO:)

>How look your colored software at a monochrome resolution like ST high?

 Dunno, I have not got a high rez monitor, mine is an old atari colour
monitor that has no side borders, cant get it fixed:(, means the
first8 pixels of the screen and the last 8 are hidden :(, thats why
you wont see much happening at the edges of my software :), seriously
:)

>scroll bars with shape and depth or 3d boxes. The GEM of your 1040 STe
>is from 1990!

 i dont see the relevance? my software still boots up and runs, and
until you show me a game made in 1996 in BASIC, then I am afraid STOS
and its old techonology are still the best in town :)

Cheers.....!ynoT

>What is the difference between al those reserve commands? IMHO memory is
>memory. I don't see the need telling to computer for what purpose memory is
>reserved. The special thing about screen memory is that is has to be aligned on

 Eeerm, for the follow up commands, the best way to explain...
Later on I may want to use a command like....MUSIC 3
 STOS will automatically look in the bank I assigned as music, this
saves me having to add perameters to the music play command,
 This is the same for fonts used in windows, sprites etc,

> > then IT IS THE SAME as all I need to do is reserve the bank and STOS
> > does the rest....why didnt you beleive me?

>Because it's unusual behavior for a memory allocationg command. Normally they
>alaing to 2 or 4 byte boundaries.

 hmmm I can only presume its easier for STOS? Dunno realy, having
never used other programming languages to the extent of memory
allocation, then I never questioned the way STOS does it?,

> >> STOS will, but does the hardware know? Does STOS start to move around
> >> banks in
> >
> > yawn...how many times?
>
>Well, as you don't have trouble my guess is STOS doesn't move it's memory banks
>when surrounding memoryblocks are released. Can someone confirm this?

 It does, eeerm I think we may have lost track of each other here, but
let me give this a shot:)

If I assign a variable to = the start address of a memory bank, eg S7=start(7)
Then at some point another bank is erased or made? then S7 will no longer = start(7) and the variable must be reset by the programmer,

BUT!..if I use STOS commands, eg screencopy 7 to physic, well I can use that in a loop all day and erase or make banks all I want, STOS will keep track of bank 7,

As for screens.....we would not usualy use a bank, screen areas are already set, PHYSIC,LOGIC and BACK, Logic being the screen your work is allways performed on unless told otherwise, so print "Tony" will allways go to the logic, a good programmer will allways set logic to = back, so work is hidden, then a screenswap command will swap the logic,physic, = instant graphics as no data is moved, only a pointer changed, I cannot see anything being faster? logic can be set to anywhere, back, physic a bank, anywhere.....

> > Extensions are upgrades to STOS programming launguage , just like any

>I guess there are a lot of extensions you can use for a lot of different
>things. So it's resonable to think there is more than one extension that
>supplies you with a command to set a block of memory to a cetain value. Maybe

All the memory allocations are done with STOS original commands, well in my work, I cant speak for all STOS programmers:), but I do not recall any commands in any extension for allocating memory, unless the termonolgy is confusing me:)

>there are commands that lets you set memoryblocks with a 2, 4, 8 or 16 byte

Unfortunatly the STOS memory banks not only round off 256, but have a minimum size of 256? or is it??, ho dear, all this off the top of my head?,

>value. You have to be able to differentiate between the commands in different
>extensions. So how is this done? How are new commands added to STOS? How do I
>make sure the command name is already in use by someone else?

extensions are obviously not made in STOS, so i cannot help you there, I know a certain amount, but it could be the blind leading the blind, making extensions is well out of my luegue i am afraid,

> > talk to yourself until you actually win a debate, probably take you
> > ages hehehe
>
>I am not trying to win a debate in this thread. I am just curious about a
>programming language that I don't know. I'd like to know how certain commands
>work. I like to know how things work.

My apologies, I found it difficult to seperate the two threads, ie
STOS and this one, SORRY :)

>What happends when you are tying te reserve memory when no memory is left? (C
>returns a NULL pointer, Omikron basic generates an 'Out of memory error.)

STOS returns error 8, out of memory....
But STOS has amongst its nifty commands and preset variables, free,
so print free return the available memory, you can allocate a bank
with "reserve as data 7,free" although free-1280 or simmilar might be
a better idea:)

Well, I wasn't expecting so much response. Thanks for all the help. To tell you the truth the day after I posted the message I went home found the bug and fixed it. I was using GFA Basic. The problem involved the passing of information for XBIOS 32 format sound between procedures. It wan't noticed on the STE because this was not being used most of the time. Anyway thanks for your replies. Next time I have a problem I'll see if I can sort it out first, then if not I'll give more info in my message to this newsgroup. Cheers.

Dan Jones.

>boundaries. Why differentiating in all those types?

Ever heard of type checking? this is rather simular. Reserving as a character set tells STOS what you are using it for, so it can tell you if you do something silly.

What is the difference between these in C?

```
char *a;
float *c;
void *d;
```

They are all pointers to memory, but have a different 'type'.

>in supervisor mode, that's is no problem because heartland is working in
>supervisor mode so you either switched to supervisor mode, or STOS is always in
>supervisor mode.

STOS is always in supervisor mode.

>Yes, some poking has to be done, but poke is also a regular
>basic command, and it is faster, so why not use it?

Because it is less eligent? Yes, using OS calls is slightly slower, but it is much neater, and easier to read (an important issue in programming large progs...) Oh, and as you previously brought up Hades etc. you cannot gaurentee that it will work...

>Well, as you don't have trouble my guess is STOS doesn't move it's memory banks
>when surrounding memoryblocks are released. Can someone confirm this?

I dont know exactly what it does, but it doesn't seem to move the banks around in my progs... I haven't examined its behaviour in too much detail because I dont tend to do things like erase/reserve banks appart from in the initialisation stages...

>value. You have to be able to differentiate between the commands in different

>extensions. So how is this done? How are new commands added to STOS? How do I
>make sure the command name is already in use by someone else?

You cannot - it is up to the extension programmer to come up with unique names.
(which is why I have all existing extensions installed so that I can recognise
 clashes - there are none at the moment)

There is a symbol table at the beginning of each extension which gives the
command name, and a byte 'token' which is used to ID the command. STOS
internally has a second byte which identifies the extension.

>What happends when you are tying te reserve memory when no memory is left? (C
>returns a NULL pointer, Omikron basic generates an 'Out of memory error.)

STOS generates an error (suprisingly 'Out of Memory'). This can be caught
by your program using the 'on error goto' command, which may handle the
error in anyway it considers fit, and then if possible 'resume'.

I'm sorry, but I have to point out that this is wrong.

STOS games can work on the Falcon - I am writing games for/on it! (go to http://www.cs.man.ac.uk/~jacquesa/tron2000/ for a sneak preview - but no demo yet).

Also, the reason STOS does not work on TT's is because I have no DEF030x.DAT files for the Generic Fixer (ie. it cannot fix for TOS 3.0x). This is due to the fact that TT owners completely ignored my repeated requests (on this and other newsgroups) for someone to spend 5 minutes creating these files for me.

Obviously TT owners are not interested in playing games, as they would have contacted me if they were!

>I translate it as:
>
>"Don't start STOS games on new atari's because they will crash!"

Why? All 'new' atari's support ST-low. Just hold down CTRL when booting and it should default to ST-Low. (or at least, my Falcon does). Where is the problem with this? Games shouldn't really be run ontop of NVDI, MultiTOS, loads of DA's etc. - you SHOULD clean boot anyway. (this isn't just STOS games btw. Comercial games such as Zero-5/Robinsons Requiem [falcon] recommend this...)

>Can a Programming Language be the best of all, if the resulting program
>won't run on new ataris? Hhmmm....

I dont know where you got this from - All atari's should be able to access ST-low (unless you only have mono monitor, of course :)

>>>memory. This is fast, but will only work on original ATARIs (ST/STe/TT/FALCON
>>>without extensions).
>>
>> without extensions? what on earth does that mean ?
>
>For example graphic extensions like AutoSwitch OverScan (for ST), VME bus
>graphic cards (for Mega STe/TT), BlowUp (for FALCON).

Yea, I agree that STOS probably wont work with these, but I can garantee that it does work with the BlowUP 1-hardware on the Falcon (as part of my FX card). And yes, you can even make use of it - I have written myself a .TGA viewer which uses 640x480xTCxVGA mode and hardware scrolling for big images...

>To be on topic:
>
>The only way to display anything on these graphic extensions is VDI/GEM.
>And STOS is not able to use VDI AVAIK.

>Here are some quotations from the ATARI Compendium:

I notice you didn't quote from the Style guide the bit that says that all software should come with (un)install software, etc. which I have not seen much evidence of...

>A faster CPU can compensate slow code. GEM code is mostly slow code.
>To make good GEM games, you can compensate the slow but compatible
>GEM code with a faster CPU.

That sounds like a Micro$oft approach to me...

>> why do all gem programmers think there is only red,green white and
>>black, surely they can change the colours here and there,
>

>Most of them have a monochrome monitor.

No, I would have said that it is they dont want to change the system
palette (this is 'bad form' ISTR the Atari Compendium saying not change
the bottom 16 colours as these are for the system...)

 Theres one hell of a good reason, for me at least,

 I enjoy writing in BASIC.....:)

>And it's still advocacy.

So what isn't advocacy, I express an opinion, someone contradicts, I thought that was one of the functions of comp.sys.atari.programmer? a place where programmers can hang out, chew the fat, discuss programming?
Admmitedly there is a difference of opinion going on, but I don't see how that can be avoided?

Now if we can get rid of all these GEM lovers we can get on with things....heheheh

> > without extensions? what on earth does that mean ?

>He means extensions like videocards, turbocards, exotic memory cards and all

 haaaa, as most of the thread had been about programming extensions
then you can see where the confusion arose :)

>other thing you can add to a normal ST, so an Atari without
>extensions is an Atari like you have, no modifications.

 aw go on say it :), you mean a sad setup like mine, dont be shy Hans,
it is a sad setup, maybe when I get some money....

 Actually someone reading this thread has offered to send me a scsi
hard drive, for free :)...I need to get the odd lead , then i will
have a hard drive,
 I doubt Rich would want me to tell the world that he is the kind
soul, so I wont mention his name ;-)
 then hold on to your seat for a really kick arse graphic adventure
:))))))

>We said your original statement was false because STOS can't do GEM games. You

 "we".....you have a twin maybe ? :-)
 So you think the only good game is GEM game, hahahaha thats silly!

>said no one wants GEM games because you think they are slow and nonresponsive
>(just like we thought about STOS). We are proving there are lots of people
>wating GEM games. Try to get a copy of Kubis '96 or WinColTris to see a mordern
>GEM game.

 no I did not quite say that, a game does not have to be GEM
compatable to be good, as soon as you realise that, then we can move
on, all atari computers should have the ability to run in atari st
low, so.....

> > Ok I never said my games where fanatastic, I said STOS is the best

>IF you don't want to make GEM games and don't care about the fact the game
>doesn't run on a TT and the game will only run on a Falcon using
>backwards.

 eerm your falcon statement is totally totally false, in fact its
total rubish, MY games need backwards, but we are talking about STOS
BASIC not my games, STOS can be used to make Fully Falcon compatable
games, STOS can be used as you will see in another posting in here for
a lot of nice falcon things, without backwards ?
 I can and indeed have made software in STOS that runs on the falcon,

without backwards, just not games, I can support TOS 401, 402, 404 and
492

> >> There is no choice between GEM games and none GEM games, because you
> >> can only run GEM games on the new powerfull atari compatible
> >> computers!

> > really? I think you will find you are WRONG

>Your game doesn't work...

 I Know, but we are not talking about MY games, and in this instance
we are not even talking about STOS, a statement was made that only GEM
made games will run on the new powerfull ATARI's, and I doubt that
very much,

Cheers.....!ynoT

If you have a graphics-card or any of the new clones you can't use ST-low.
The main problem is that the ST use bitplanes whereas all graphics-card
use chunky mode. If you don't want to write routines specifically for each
type of graphics-card, the only solution is to use VDI. It's quite
acceptable on faster machines, but not on ST's. Forget it. GEM is OK for
games that doesn't require speed and complex graphics but not for
arcade-games.

However, if you don't fix STOS-games (That's designed to run on ST's.)
they won't work on Falcons even if they're running in ST-Low. Wouldn't it
be a solution to somehow include a generic STOS-fixer in the game itself
(It obviously has to run before the compiled STOS-code is executed.)
so that the user don't have to do this? This way the game should be able
to run on about every Atari out there that can use ST-Low.

 I tried AMOS, maybe it was the machine I didnt like working on, or maybe too long in STOS, but I definatly did not like AMOS ,

>> I would say that posting a message in a programming newsgroup saying
>>BASIC is useless, when you have used software written in it, wether

>Perhaps you should try looking outside the (very) small world of BASIC

 For what ?, why would I want to when BASIC is doing everything I personally ask of it ?

>and see what else is out there. You're obviously a very skilled
>programmer (I've seen a couple of your games and they were cool!),

 <blush> ta :)

>if you spent some time learning a more powerful language you could
>write better games in the same or less amount of time you use now.

  But would I enjot it? you see I have looked at C and tried a couple of tutorials and I simply didnt like the look of it, assembler looks even less enjoyable, I liked the little play around I had with Pascal and indeed am awaiting a copy of Personal Pascal as we speak,
 I have recently aquired hisoft2 basic and gfa 3.5, I am looking to make a serious application that needs GEM you see <duck!>
 But would not even contemplate making a game out of any of them,

>The time you save by being able to write one line of code instead of
>three to plot a sprite is quickly consumed by the additional time you
>use to maintain large sources with line numbers, goto's and gosub's.

eeerm sorry? I did not understand that last statement, serious ?

>Your original posting said something like "STOS is the best BASIC to
>write games with", and that's correct. But you included C too, which
>is more powerful than STOS no matter what you say. You claim that you

The point I was trying to make, was that if someone wants to make a game now, then the best software, up to C that they could use is STOS BASIC, it is something I believe and stand by,
The original statement was to, start a thread in an otherwise empty and boring newsgroup :), have a healthy debate with other BASIC coders and generally liven things up, it was not designed to upset people or make enemies,
NOTHING has been said to make me even consider retracting my original statement, maybe if someone shows me something instead of trying to tell me ? :)...but of course that cannot be done, thus strenghning my beliefs,
BTW this was never intended to be about MY software, but about STOS BASIC, I merely used mine as examples as it would not be fair to use other peopels un invited,

>write your games in ("Upgraded") STOS. OK, if I wrote a library like
>"Missing Link" for C, could I write a game with it and claim that I
>use nothing but "upgraded C"? I couldn't, 'cause I used C and an

haha you are joking?

>additional library, just like your extensions. They're not a part of
>the language, and no sane person would say that the language BASIC is
>more powerful than C??

You are making 2 points here, the last I agree, I never said or even hinted that BASIC is the most powerfull language, I already wrote that other languages are more powerfull and I think I even used the termanology you just did and said...only an idiot would... C is more powerfull, I know that.....but that still does not alter the fact, just because something is more powerfull then it doesent mean its the best tool for the job,

Your first point however falls flat on its face and you are falling into the same trap everyone else seems so intent on doing,

The original authors of STOS BASIC made it in such a way that when it would need upgrading, they could add the commands by way of extensions, you add these to your programming folder that holds the original commands, they are extra commands loaded into your language disk, they are not programming libraries, they are upgrades, STOS BASIC LANGUAGE UPGRADES,

This is the problem, some of you think of them as libraries and make comparisons with C libraries, thats rubbish, you have to realise that extensions are language upgrades, therefore if I use extensions, I am making my game in STOS BASIC, nothing more nothing less, but I do

point out that it is a much upgraded STOS BASIC,
Cheers.....!ynoT

Hehehehe.... or even, just pass it through my "Generic STOS Fixer v1.3"
(see my WWW pages... :) which will pre-fix a STOS program for multiple
OS versions (except TT versions as TT owners are too lazy/dis-interested
to contact me).

Tony knows about this, but as there are other problems with Heartland
and Dimond Ice, I dont think he bothered. As for before that... well,
it just wasn't released!

Anthony

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I'm not the only one that thinks that way either. It wasn't just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can't be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I'm 26 now and many of the things I'm telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say "You can do it... It'll be okay." I've never been able to make a good attempt at trying to repay her for all she's done for me and I'm not alone. Many people just have taken for granted the things she's done for them.

I know by now you're asking yourself why I've posted this letter. Well, to be honest and straight with you it's because I would like your help. If there's one thing that I've learned from Wendy it's that, "We are our neighbors keepers." You know the golden rule, "Do onto others as you would have them do onto you." Anyway now Wendy is an older lady that is disabled and can't do as much as she used to. With the disability sometimes expenses can be too much. I now live in

Arkansas and can't be of much help. With no real family I'd like to do something to try to repay all she done for me and many others.

That's were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it's someone you can't even remember or have lost touch with. For that moment picture Wendy and say, "I'd like to repay that kindness." I wish you would sit down and write a small note saying "Thanks for being the generous person that you have been!" If you could include something to help out. Maybe it's a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin sends his love. Her birthday is next month on the 27th and I'm hoping I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

Wendy Mcghee

The latter is true, it wasnt available,

But you are being a bit pre emptive with Diamond-Ice? it isn't even released yet, and NEWS!!! I have fixed it and Flinny tried it on his Falcon TOS 4.04 and it works, So Diamond-Ice will be released as Falcon Compatable,
Anthony, theres also an improved Sample that will play on the Falcon, and any Ste with more than one meg :), the only thing that will be missing on the Falcon version is the very nifty intro routine :)

(Yes Backwards and ST Low will be needed<G>)

See, I am trying to convert you all, My programs are fixed automatically during compilation, the compiler has been upgraded as well you see.....whoops I forgot to mention that,
I am releasing a game this weekend, it will not need STOS fix to work on the Falcon, it has already been tested and works on a Falcon tos 404 (Thanks Flinny) and will handle tos 401,402 and 492 as well,
and yes it will need backwards.....

Pascal was designed to teach programming, it was never ment as a
programming language to do real programming with. (Real programming is any
programming that solves problems exceeding the level of problems
encountered in the regular 'programming for beginers' courses.

 >>

>> HO SHIT!!! I just ordered Personal Pascal :(.....I did!

Hey, I thought you could already program?? Ah, now I remember, you never picked up the use of funtions. Though I think it's a bit of over kill to buy pascal for that purpose. ;-)

> hehe! It's not _that_ bad because they all come with extensions to
> the standard. Pascal was my first compiled language and I think traces

> incomprehensible rubbish when comprehensible rubbish will do!

That's exactly what makes pascal bad as a real programming language. ISO Pascal (the official standard pascal), is a cripple language, not usable for real programming. To make Pascal more usable people made extensions to the standard, but the problem is that different pascal versions are extended in their own particular way, so those versions are incompatible with each other.

If you are sure you are going to use that compiler the next couple of years there is no problem with that, but if your program should be compiled on different systems. The programming project I am working on compiles on multiple platforms with different compilers (TOS: Pure C and GNU C; Linux (68k and ix86): GNU C; DOS: Watcom C and Microsnot C). (Be warned, using C doesn't mean it's portable, but it is possible to write portable code.)

Even the designer of pascal, Nicklaus Wirth, agrees with the fact that pascal is not usable to do real programming that's why he designed
Modula 2. That language is able to handle real life problems. I don't like that language though.

The best mutitasking language I know of is Occam, the teacher told us horror strories about Ada and parallel C.

So memory banks are very thight coupled with the command set. How does this affect new or improved commands?
Example: I want to use a Digmax tune or a Countzero tune, these music types have to be initialized and played in a different way (if I remeber it correct, there are a lot of different chip music formats.)
Same thing for a sprite routine. How is a bank matched to the right sprite routine?

> hmmm I can only presume its easier for STOS? Dunno realy, having

Seems so. Creating a lot of trouble to understand each other.

>> Well, as you don't have trouble my guess is STOS doesn't move it's
>> memory banks when surrounding memoryblocks are released. Can someone

> longer = start(7) and the variable must be reset by the programmer,

OK, how do you know when that moment arrived? Just by keeping track on which banks are used and when a bank get released?
And that was the point I tried to make. If the displayed screen is located in that bank you the shifter could display the wrong memory area but it looks like STOS can keep track of the memory adresses because you are telling STOS what

adress should be used. (I wasn't so honest to Omikron).

> allways go to the logic, a good programmer will allways set logic to
> = back, so work is hidden, then a screenswap command will swap the

Hmnm, I am a bad programmer then. Most parts of my demo use only on screen. I simply make sure I update a part of the screen after is was displayed by the shifter.

> logic,physic, = instant graphics as no data is moved, only a pointer
> changed, I cannot see anything being faster? logic can be set to
> anywhere, back, physic a bank, anywhere.....

You can't see anything being faster because you don't know what happens after you told STOS you want to switchthe pointer. The data displayed won't change until the shifter has been told the screen is at an other adres. And how do you tell the shifter which adress is the screen adres?

By:

```
poke $ff8201,(screenadres shr 16)
poke $ff8203,(screenadres shr 8)
```

All other commands will eventually write to those hardware registers.

>> I guess there are a lot of extensions you can use for a lot of

Yes it is I think. By setting memory I mean setting the bytes (words etc.) in a memory block ro a certain value. So the question

>> there are commands that lets you set memoryblocks with a 2, 4, 8 or 16
>> byte

means: are there different commands that let you set the bytes in a given memory block to a given value? And are there other commands that allow you to set a block 2, 4, 8 or 16 bytes into a certain value?

> extensions are obviously not made in STOS, so i cannot help you
> there, I know a certain amount, but it could be the blind leading the
> blind, making extensions is well out of my luegue i am afraid,

Ok, but how do you use extensions? I think there is something like a library with a lot of functions. I asume you can use multiple libraries at the same time in a program (one for the sound, an other for sprites and maybe again an other for doing heavy duty memory moves). What happens if two functions in different

libraries have the same name?

> My apologies, I found it difficult to seperate the two threads, ie
> STOS and this one, SORRY :)

I can understand that. I would kill someone who attacks me too! (First shoot, then ask 'Wa d'ya want?'. That's the safest way.)

> STOS returns error 8, out of memory....
> But STOS has amongst its nifty commands and preset variables, free,
> so print free return the available memory, you can allocate a bank

Just like all other basics I know of. It will give trouble on multi tasking systems. Because in the time you determine the amount of free memory and the moment you try to allocate it, an other application might grap a huge block of memory, leaving your program no other option than to generate a error. But lucky us, multitasking is of no importance here.

> with "reserve as data 7,free" although free-1280 or simmilar might be
> a better idea:)

Still wouldn't be a great way of programming. Can you determine the size of a reserved memory block after it has been reserved. Like in your example, can you determine the size of bank 7?

I don't know. On a plain 1040ST (1Mb) there are about eight scanlines left before the start of the VBL. Don't know how much time is needed on a STe nor the amount of time needed to display the sprite. You are the only one that can find out by placing rasters around the routine that displays the main character. If you say there is not enough time left I won't argue about that.

Bye, Hans Wessels

BTW: I can't get to the last eleven coins. Eight of them are located very high, left from the middle on the lower half of the map. The other three are located on the first level above ground level where the longest slide of the game ends (It's also on the upper half of the map.). Can you give me a hint how to get there? And will those eleven coins give me enhough points to break the 3k limit? (Now I have 2620 points, only the eleven coins and the ace card to go.)

Most of them are simulation games and don't compare to the Arcade games Tony makes. The number of Arcade games running with speeder boards is less. Most DMA loaders won't work. Using the hacked version of the game solves that problem. Jeff Minter games work on speedy Atari's and that are real arcade games, but I guess Jeff doesn't use basic. :-)

> >> Can a Programming Language be the best of all, if the resulting

> > YES, when there is nothing better about?, a game made in BASIC that
> > works on most ATARIs is better than a none existant game, how many
> > ATARIs will that work on, no game=no ATARI's...yes?

Ok Tony, let me see... We have the following C games:
Kubis '96, WinColTris and Nethack running under GEM. (I think the most GEM games are written in C, but I haven't tested them so I can't prove it to you.)
GNU chess working character based.

All those games work on all Ataris, under all resolutions, maybe some of those games require you to have a harddisk (I usually don't test a game from floppy disk if I can run it from harddisk).

If you want to have more GEM games, maybe even written in Gfa (or another basic), just plunder a German Atari ftp site.

So either we can remove C from the challenge list, or we have to concentrate on arcade games running in ST LOW. The best way is to remove C from the challenge list, because then most of the original statement is still true. But the moment a basic GEM game is found your statement collapses again. So maybe it safer to concentrate on arcade games running in ST LOW.

So what's it gonna be? (Wow, dirty question, answering it means you agree you starting statement was false!)

> >> So tell me how do you would switch resolution from:
> >>
> >> - ST low with AS OverScan (368x264x16) to ST low (320x200x16)

Hey Uwe, what AS Overscan driver are you using? Mine does only (400x240x16) in ST low. How do you get the 24 extra scanlines? (My settings are (400x240x16) in ST LOW, (816x240x4) in ST medium and (720x480x2) in ST HIGH (I have got a SM144 monitor for high res, they are faster with the horizontal retrace).

>
> You see I am talking about the majority, are you seriously trying to

Autoswitch Overscan has, but go to a VGA type card and you say good bye to the good old ST resolutions.

> may not be the best all round BASIC for the ATARI and my games may

Are we allowing C or not? The original statement included C.

: >10000-line *structured*, easy-to-read source in STOS! Let's face it,
: >the programming-language itself is crap. No procedures, no functions
Speaking as someone who is working on a project with 27 classes all in MSDev
Studio I would say that there is not much diffence over structure Vs Basic

style. What is important is you get to know the code, make sure it is neat
and comment it. Your textbook folk will say procs etc are so wonderful but
practically there is little difference! BTW gosubs can be given labels in STOS
e.g. X=500:Gosub X

: Thats a matter of opinion, there are a lot of people using it, surely
: that tells us something?
Yep. We still see more STOS stuff than anything else.

: >and no dynamic datastructures (No datastructures at all except for
Not that useful in games programming but would be nice I suppose.
Always memory on disk so using files you could do what you like so not a total
limitation.

: >Perhaps you should try looking outside the (very) small world of BASIC
Visual BASIC is very very popular on a platform that has something as
structured and powerful as VC++??

: For what ?, why would I want to when BASIC is doing everything I
: personally ask of it ?
Exactly. Instead of time spent on learning GEM you can use what is already
available to you. STOS wimp features are really easy to use and are amongst
the best I have used including 32bit windows!!

: make a serious application that needs GEM you see <duck!>
Sigh and we were hoping for a decent GEM game... :-)

: >use to maintain large sources with line numbers, goto's and gosub's.
Nope this is rubbish. Get a printout, a notepad and a ballpoint pen and it is
fine! You don't have to use goto at all. That is to do with good style - not
the language itself.

: The original statement was to, start a thread in an otherwise empty
: and boring newsgroup :), have a healthy debate with other BASIC coders
Uk.comp.misc was more exciting than this place until a wee while ago! <wink>

: >additional library, just like your extensions. They're not a part of
: >the language, and no sane person would say that the language BASIC is
: >more powerful than C??
Visual Basic is more powerful than my C compiler! No easy database support..
No easy GUI...

agape,
Davy

No problems with fullscreen demos. Same to spectrum viewers (f.e. Photochrome)

Hello wizards out there,

I'm busy writing an app in Pure Pascal that features dialog boxes in AES windows. It works, but what I couldn't figure out yet is how to underline a char in, say, an exit button, radio button or such. This is, as you know, used to indicate which key to press with the Alternate key to select the button via keyboard.

Now, everyone does this. How's it done? Do I need to transform the buttons to G_USERDEF objects, or G_FBOXTEXT objects? Or do you just put the lines in there with appropriate VDI calls? With a week of trying, I might end up with something that works, and I'm not looking for ready source code here, just hints in the general direction would be appreciated -- I don't plan on writing something that sort of works, but in a different way than the way it should.

Please do reply via email, because I don't yet have access to Usenet on a regular basis. If there is sufficient interest, I'll post a HOWTO here when I've arrived at a solution. This goes for all problems with window dialogs... if anyone out there has a related question, feel free to mail me. Who knows? I might even be able to help you.

And please *don't* ask why I don't want to use anyone's library to do this... it's an altogether different and potentially lengthy discussion in there, as is in why do I use Pascal. :-)

Oh, BTW, what's this Personal Pascal thing about? Am I missing something dramatic here?

Thank you for your time.
Yours, Erik.

Got a sample at the right frequency then. :-)

> (Yes Backwards and ST Low will be needed<G>)

I assume Backwards to slow it down to 8Mhz. I guess its not wise for me to run it at 36Mhz then. :-)

>Jeff Minter games work on speedy Atari's and that are real arcade games, but I
>guess Jeff doesn't use basic. :-)

What are you talking about? Jeff's games DO NOT work on fast Atari's without changing from the standard setup. The reason for this is that Jeff uses self modifying code in his sample replay code. This causes a crash on any machine with a data cache that is operational (ie. Falcon, TT, and probably Hades etc.) Yes, disabling the cache improves compatability.

(note that his STE/TT versions dont play sound on Falcon's either - for the same reason that Heartland doesn't - Atari redefined the lowest speed to be sample off)

- all this is based on Llamatron, Revenge, Revenge STE and Hardcore demo. Obviously Llamazap only works on Falcons, Trip-a-tron (not a game, but hey) has problems on an STE - and doesn't do any better on a Falcon. 'Thingy' (I believe an early version of colourspace ST) DOES work, although it doesn't correctly change mode at the beginning, so you have to start in ST-Low. I cannot remember what colourspace did (I think it worked from ST low)

>Ok Tony, let me see... We have the following C games:

I would be prepared to bet that Tony cannot run Nethack (GEM version, that is) as I believe this needs 640x400 minimum rez...

Well, nothing would happen anyway - as STOS allocates all the RAM it can at
the begining, and when a STOS program 'frees' memory it doesn't actually
free it back to the system - just the STOS memory manager.

Also, as already pointed out, STOS runs in supervisor mode, so there is no
chance that another task can grab some memory... :)

>reserved memory block after it has been reserved. Like in your example, can you
>determine the size of bank 7?

yep length(7) gives this.

>Ok Tony, let me see... We have the following C games:
>Kubis '96, WinColTris and Nethack running under GEM. (I think the most GEM
>games are written in C, but I haven't tested them so I can't prove it to you.)

 So you also cannot tell me wether they are any good? and until you
can, then My statement stands, I am not for one moment suggesting they
are not good, I have not seen them, but for them to have ANY relevence
to this thread then they must be good games made in BASIC or C (with
no added mc) and have been made in 1996

>All those games work on all Ataris, under all resolutions, maybe some of those
>games require you to have a harddisk (I usually don't test a game from floppy
>disk if I can run it from harddisk).

 if they require a hd then they are definatly not a reccomended good
game, MOST atarians do not own hard drives,

>If you want to have more GEM games, maybe even written in Gfa (or another
>basic), just plunder a German Atari ftp site.

 But are they made in 1996 and how would we know if they are simple
BASIC shells calling lots of m/c?

>So either we can remove C from the challenge list, or we have to

Certainly not!

>concentrate on arcade games running in ST LOW. The best way is to remove C from

 No, you have said nothing to convince me, and more importantly you
have shown me nothing to convince me,

>the challenge list, because then most of the original statement is still true.
>But the moment a basic GEM game is found your statement collapses again. So

 No, then we decide which is best, but you havent even found a good
game written in 1996 BASCIC or C yet!

>maybe it safer to concentrate on arcade games running in ST LOW.

 NO, My statement stands until you or someone else shows me something
made in BASIC or C in 96 that is better than a STOS made game, you are
very good at talking, but no one can play that ?

>So what's it gonna be? (Wow, dirty question, answering it means you agree you
>starting statement was false!)

 Yeagh?...see above, this is not Chess, I cannot be cornered or pushed
into a false move,
 You see I will be quite happy to say ok, x language is better for

making games in this day and age, if you show me something, but with
the best will in the world i can not say that now just because you say
its possible, SHOW ME!

> > But also have the ability to use ATARI ST low, so ????
>
>Autoswitch Overscan has, but go to a VGA type card and you say good bye to the
>good old ST resolutions.

AW Give us a break, you have to draw the line somewhere,

Q when is an ATARI not an ATARI
A when it cannot even handle standard ATARI screen resolutions

Having these extra screen resolutions is great, I saw some in action
at the recent English ATARI shows and I was gobsmacked, with a mega
STe (owned by Harry Sideras A.A.U.G.) looking a lot better than any of
the falcons on show, it had far better screen display etc,
BUT If a machine does not even have the capabilities to run a
standard ATARI resolution then is it realy an ATARI in the true spirit
of the thread, if so, then where do you draw the line, or will we next
be told that STOS is sad because it wont work on an ATARI Jaguar, or
maybe an ATARI 800XL Computer,
All this talk of Hades and Madusa etc, it really is taking things a
little too far dont you think,

How many Hades Computers have been sold
How many of these people will want a game made on a ST

There aint going to be enough to even warrant booting STOS, get real
please :)

> > may not be the best all round BASIC for the ATARI and my games may
> > not be the best in town, until you show me better, written in BASIC
> > in 1996, then my statement is proven to be true?
>
>Are we allowing C or not? The original statement included C.

Yes we are allowing C, my original statement seems to gain strength
with every posting you make :)

 I can't get GFA v3.5 running under STonX either. However, STonX *is*
able to run my compiled GFA programs, so if you can get what you want
compiled on an Atari then you can run on the PC under Linux/STonX.

>around in my progs... I haven't examined its behaviour in too much detail
>because I dont tend to do things like erase/reserve banks appart from in
>the initialisation stages...

This is what I am trying to get accross, I don't know if its simply habit, but I usually set up all my banks, arrays etc, have everything I am going to need later, all ready before the game starts, a little like a Chef would lay out his ingrediants and utensils, I would not want to trye erasing or allocating banks in the middle of a game loop,

However I have found it to be true that setting a variable as the start of a bank then erasing reserving other banks can cause an address error, I usually have my variable = bank commands right at the end of the setup, best just before the main program loop starts, that way you know they will all point to the correct place,

>STOS generates an error (suprisingly 'Out of Memory'). This can be caught
>by your program using the 'on error goto' command, which may handle the
>error in anyway it considers fit, and then if possible 'resume'.

If I know this is a possibility in the program then I first reserve a small bank of memory, as soon as my program detects an error 8 (out of memory) it erases the bank, thus freeing enough memory to draw ..maybe a nice alert box etc and an involved error routine, such as a mini menu featuring, try again, go back to? , quit, cold boot, warm boot etc,
This should only be neccasay in a program that allows user input of some sort, ?

Cheers.....!ynoT

>Aha! Cool. Why didn't you say so? :-)))

 Only got the final OK from Flinny that it worked littraly hours before that posting, I had used the compiler fixer, but as I pointed out, thats a bit limiting as you are set to certain tos versions, once I fixed it with Generic it worked alright, well I presume it was that as I also stopped it going to the intro if >TOS 2.06 detected, some nasty chip music in intro you see ?,
 BTW using Martins EXTRA...if val(os version$)>n.nn then ????

 Hey what about PC MART...And everyone get PC MART, next issue I
think?, they are printing an article about ATARI, by eeeeerrm ? and I
don't mention STOS in it :))), its either next, or the one after
crimbo:)

 As to your suggestions, this is exactly what we are going to do with
diamond-ice, no pdls, just available through me by email, or snail to
my artist partner, each copy will have the name of the owner on the
play screen,
 This is to keep track of how many people are interested in our
software?
 We will advertiose the game through all known user groups,
diskmagazines, free paper magazines and hopefully get soemthing
reviewed in Atari Computing,
 The game will be FREE, but we simply want to keep track to see wether
its all worth while,

Cheers.....!ynoT

oo, I'm not sure we should get into a debate about what is portable
and what is not - that would be the never ending thread. :-) I do see
your point however.

>Even the designer of pascal, Nicklaus Wirth, agrees with the fact that
>pascal is not usable to do real programming that's why he designed

I purchased Pascal & C at the same time. I could already program
Pascal well and knew nothing whatsoever about C. Even with this bias,
it did not take me long to decide C was the better long term prospect.
Had modula 2 been available at the time, things might have been

different. Fortunately it wasn't - I would have regretted never
learning C.

Better clarify libraries here as both sides are in danger of getting
themselves into a corner :-)

A compiler library (this is not C specific) most usually consists of
pre-compiled source code. When the main program makes reference to a
particular command then it is noted. Once everything is compiled, the
linker has the job of going through all these "unknown" commands and
attempts to find those commands in the libraries you have told it to

use. If it finds them all you get an executable program otherwise you get an error.

To add new STOS commands you need an extention. To add new compiler commands you need a library. In effect they are the same thing. STOS is to be praised for providing the facility at all, especially when you consider how long ago it was since it first came out.

The power of a library is you can choose what to put in it (or take out / replace) yourself. If I find I have written the same routine more than a few times, I tend to generalise it and add it into one of my libraries. I never have to write it (or compile it) again. Same thing with STOS - may be hard for the user to do but it is possible thus both are the same!

> > saves me having to add perameters to the music play command,
> > This is the same for fonts used in windows, sprites etc,

>So memory banks are very thight coupled with the command set. How does this
>affect new or improved commands?

 One of the reasons the new commands are faster is that a lot of the
control is taken away from STOS, you have to use variables to keep

track of the start of banks for just about all the new commands

>Example: I want to use a Digmax tune or a Countzero tune, these music types
>have to be initialized and played in a different way (if I remeber it correct,
>there are a lot of different chip music formats.)

 hehehehe, variable=musauto(start(?),tune_number,length(?))
 that command recognises most (about 20+ i think) formas of chip music

>Same thing for a sprite routine. How is a bank matched to the right sprite
>routine?

 ok the new sprite commands=BOBS or one bitplane JOEYS
 BOB DESTINATION_SCREEN,BOB_DATA,IMG,X,Y,etc

 if i use start(7) as bob data then stos will always know the bobs are
there, its a compltete replacement to stos sprites so stos doesent
care whats in there, but as a variable is faster then I would use a
variable and re assign if any memory is allocated while the routine is
running, but that never happens,

>> > hmmm I can only presume its easier for STOS? Dunno realy, having
> > never used other programming languages to the extent of memory
> > allocation, then I never questioned the way STOS does it?,

>Seems so. Creating a lot of trouble to understand each other.

 Thats due to the major differences in the programming languages, I
have never heard of "memloc" before ? for instance :)

> > Then at some point another bank is erased or made? then S7 will no
> > longer = start(7) and the variable must be reset by the programmer,
>
>OK, how do you know when that moment arrived? Just by keeping track on which
>banks are used and when a bank get released?

 Yep, but to be honest I never do any memory bank erasing allocating
while a program loop is running, all that is as I tried to explain,
done in the setup routines ?

>And that was the point I tried to make. If the displayed screen is located in
>that bank you the shifter could display the wrong memory area but it looks like

 No because dont shift memory while the game is being played, ie
while the main loop is running,

> > allways go to the logic, a good programmer will allways set logic to
> > = back, so work is hidden, then a screenswap command will swap the

>Hmnm, I am a bad programmer then. Most parts of my demo use only on screen. I

Ho dont be silly, I meant a good STOS programmer, sheesh! :)) we have
a differnet screen set up, we dont use GEM, remember? so are not
restricted to the GEM way of doing things, whatever that is?,

>until the shifter has been told the screen is at an other adres. And how do you
>tell the shifter which adress is the screen adres?

STOS Allways knows where Physic, Logic and Back are, so a screenswap
command will swap the pointers between physic and Logic, physic,logic
and back are all preset variables, so PRINT PHYSIC will return the
adress of the physical screen, same with logic and back :) ?

>poke $ff8201,(screenadres shr 16)
>poke $ff8203,(screenadres shr 8)

>All other commands will eventually write to those hardware registers.

ho look! more pokes.....hmmmmmm

> > not recall any commands in any extension for allocating memory, unless
> > the termonolgy is confusing me:)

>means: are there different commands that let you set the bytes in a given
>memory block to a given value? And are there other commands that allow you to
>set a block 2, 4, 8 or 16 bytes into a certain value?

sorry, but you are still totally confusing me here? I have no idea
what you are talking about? honest!

> > blind, making extensions is well out of my luegue i am afraid,

>Ok, but how do you use extensions? I think there is something like a library
>with a lot of functions. I asume you can use multiple libraries at the same time

Yep but everything has a limit, extensions is 26, and each extension
will only allow x amount of commands, soory no idea what x is?

>in a program (one for the sound, an other for sprites and maybe again an other
>for doing heavy duty memory moves). What happens if two functions in different
>libraries have the same name?

then you have a crash!.....however extension makers will find out
what other extensions are available and try to work around it, hence
some very funny sounding commands :)

> > so print free return the available memory, you can allocate a bank

>Just like all other basics I know of. It will give trouble on multi tasking

 Well I havent tried all other BASIC so I would not know?

>memory, leaving your program no other option than to generate a error. But lucky
>us, multitasking is of no importance here.

 Yawn.....ZZZZzzzzzzzz.....

> > with "reserve as data 7,free" although free-1280 or simmilar might be
> > a better idea:)

>reserved memory block after it has been reserved. Like in your example, can you
>determine the size of bank 7?

 You mean like
print length(7) or x=length(7)

 So why would it not be a great way of programming?, so long as all
this is done outside of the game loop, then whats the problem, and why
do any memory setting from within the game loop, surely that IS bad
programming ? :)

Cheers.....!ynoT

Yes I would like to point out that this bank 7 bit was purely as
simple as possible an example I could give of what a bank is to a none
STOS user,

Yep
```
RESERVE AS WORK 7,64000
BNK=START(7)
REPEAT
PHYSIC=BNK :WAIT VBL
BNK=BNK+1280
UNTIL FALSE
```

And hey presto, cheap hardware scrolling at 8 pixels on a FM, can be

done at 4 pixels but uses twice the memory :)
 The above was to ei: something, dont actually do it like that for
gawds sake :)

Cheers.....!ynoT

You don't need ST_guide; any plain-text editor will do (I create HTML documents both personally and professionally, and I use either Wordpad or Everest, depending on which system I happen to be sitting in front of).

You can use CAB (or Webspace) to view your results; if you happen to be running STeno as a desk accessory it's easy to flip back and forth between the editor and viewer.

First, examine the source of a page which displays the features you are interested in. First principle of programming: Steal from the best. Make no mistake, HTML code /is/ programming.

Second, create a "blank page" template containing the minimum required headers (e.g., <HTML><BODY></BODY></HTML>) and any "vanity" headers you want included in all of your pages.

Now load the template, and start copying the parts of the other page that interest you. Don't be afraid to experiment! You can't damage your computer with HTML, and there's no such thing as a "finished" Web page, so keep trying things until you like the results. Each time you save the page, load up or switch over to your Browser and look at what you have so far.

Most important: Have fun!

Using MagXDesk select the GFa application, and goto options->Install
Application and limit the memory available to it say 2500k on a 4mb
machine. This will cure the problem with selection boxes caused by GFA
hogging all the memory, if not try setting to run as a single task.

> This is not what you get with a GEM based game.

The first thing I tried to find out when I read Tony's original posting, was what he exactly ment with 'game programming' and 'best'. (A least, that was my intention.) He made it clear that game programming is simply game programming, so every game has to be accounted.

So I have got two ways to prove his statement is false:
1: Prove there are games that can't be written in STOS.
  Well, even Tony says GEM games can't be done in STOS so let's forget this point.

2: Prove there are better games done in an other basic than STOS, or C. This is a bit harder to do because haven't been very active in the ST gaming and demo scene since I completed my Omikron Basic demo (about 3 or 4

years ago).

Maybe I will convert the main menu of my demo into a Pacman game, then the second point will be solved too (Mowzis creeble, just suffered an ego overflow). But first I will try to locate a Gfa basic game that meets my arcade criteria. I don't bother to look for C arcade games because a c-programmer that writes an arcade game in C probabely can't stand the temptation of optimizing some parts in assembly and by that ruling the game out of the competition.

Now the point of best. That's an other hard point. Let's assume the best language is the language that produces the best games, no matter how hard it is to make such a best game in the language of choice. To see if a game is good we have to look at the game type. A simulation game like 'Civilisation' has to meet other criteria as a puzzle game like 'Sokoban' or an arcade game like 'Heartland'. And indeed, a good arcade game has among other things 1 vbl screen updates, direct reactions to the joystick, precise and symetric sprite control according to my standards. (There is also the need for good graphics, game concept, game play. But these are more design issues, not very language dependent.)

> If your definition of 'best' means that this is of no consequence, why
> mention the VBL figures. Also, if following this line of reasoning, a
> demo would be of no use as proof either way, as all this is showing is
> the speed of execution.

When we are evaluating arcade games, the main menu of my demo comes close to an arcade game. There is nothing to play against, but all other factors are there.

Hans Wessels

BTW:
> most computer terminology is multi-lingual as it was invented WAY after
> the languages had formed...)

But language purists see the danger of people understanding each other so they make German people talk about Festplatten, Dateien, Speicher und Tastaturen and french porgrammers have to talk about octets (forgot the other french computer terms I came across).

No, I think you have messed you bombs up. Word or longword reads from a uneven adres causes an adress error. And an adress error causes three (3) bombs.

Ok, source code now we're getting somewhere. Two questions:
1: How do you align your screens?

Screen memory has to start on a 256 byte boundary on a plain ST. I don't see any aligning. In omikron I would do something like:

```
  Scr=memory(64256)            ' Get some memory
  scr+=256                     ' anticipate round down
  scr=scr and $ffff00          ' get 256 byte boundary
  repeat
    scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate videobase
    lpoke $ff8200,scrp         ' poke directly into hardware register
    wvbl                       ' wait for vbl
    scr+=1280                  ' change offset
  until(0)
```

2: What if banks get delete around bank 7? The memory manager of STOS will move the bank in memory and so your screen data will be moved, resulting in the wrong memory will be displayed. So will something like this work?

```
  reserve as work 6,10000
  reserve as work 7,32000
  reserve as work 8,9000
  memp=start(6)
  for i=0 to 9999
    poke memp+i,0    ' clear bank 6
  next i
  memp = start(7)
  for i=0 to 31999
    poke memp+i,255  ' set bank 7
  next i
  memp = start(8)
  for i =0 to 8999
    poke memp+i,0    ' clear bank 8
  next i
  physic=start(7)    ' display bank 7 (should be black)
  wait vbl
  free(6)            ' release bank 6
  free(8)            ' release bank 8
  garbage collect    ' force garbage collection (I am not sure of the
                     '  command)
  wait vbl           ' screen should be still black
  memp = start(7)
  for i = 0 to 31999
    poke memp+i,0    ' clear bank 7
```

```
  next i
  wait vbl           ' screen should be white
```

Just curious.

>why we dont see all that many games written in pure asm. these days...

 Yes and I would suggest that the incentive is not there, commercial
games must be dead, shareware has never IMHO been a way to go for
games, some acceptions of course, but not really?,
 Personally my incebtive was always to try and make something in the
hope that it would be good enough to appear on a cover disk, that way
you at least knew that people would see your work, if not on a cover
disk then a review in a magazine, however all that has gone it would
seem :(

 My ONLY incentive for making games, or whatever? is feedback, nothing
else, there is no other incentive to make FREE software, enough
feedback is good enough for me to keep going, but anyone else?..
 BTW "me" includes my artist partner who thinks the same:)

>Having said that, there was enough negative feedback to convince Tony not to start
>doing edu. stuff and to do heartland/dimond-ice instead, so it cannot be /that/
>dead.

True, I really did think there was a gap to be filled, some decent educational titles, but only two responded, a better response was gained when a graphical adventure was mentioned, it would seem most like that idea,
But although everyone liked Heartland, they all asked where the puzzle was?, I explained the idea was a fast and SIMPLE platformer but having taken note of how many wanted a puzzle, thats what DIAMOND ICE is, simmilar to hearland, but with more animation, no doors! but with charactors to meet and talk to, objects to find and use etc, a reet good puzzle :)

>> <Cue several replies from the STOS mailing list!>

cue sublime advertising by Tony :)

>hehehe... I was almost tempted NOT to reply. :)

But you where having such a quiet day at school?....sorry uni?
hehehe :)

>MagicPC (demo)   : No use, due to disc only file access

 I can only find the above in German, thats not a complaint BTW just
no good to me personally,

>Gemulator96 (demo, with MagicPC Magic_OS 1.0 96/6/26):
>   same problems as MagicPC full version

 I am using under WIN95 Gemulator96 Demo, MagiC 4.1 and Terradesktop,
in the auto folder I have NVDI 2.? and selectric file selector,
 I was having problems with some filesectors that certain programs
used, but selectric solved the lot..for me, I have not tried GFA but
am having no problems with anything else, including the demo of Hisoft
Basic2,

>doesent). Using Gemini1.999(!) as a replacement makes it even worse,
>as gemini is not able to open any drives ("Error: fgetinfo failed").
>Using the supllied shell tells me: "Not enough memory to open

 Yes I cant open a window to view any hardrive if I use my preffered
desktop (the excellent) Thing, I get out of memory error, and yes I am
using 16 meg, however the demos only allocate 2 meg to the emulator,
but still that should be enough,

>So please, has anyone an idea how to continue??

 Sorry I have not tried GFA purely because I dont own it, NO other
reason :), just thought something in the above might help:) ?

Cheers.....!ynoT

This in itself may not be so stunning as it first seems. I read some years ago (I cannot remember where) that about half of all the computers sold by Atari worldwide went to Germany (and, furthermore, those sold there were on the average heavier models - megas, TTs etc - than elsewhere). THAT, admittedly, IS stunning (if true) and so is the circumstance that the American "home land" of Atari doesn't seem to have more Atari computers/users than Britain or France with less than a fourth of the US population. All this may possibly be explained by Europeans in general and Germans in particular being more clever and progressive than the conservative Americans. But, seriously speaking, I think it may also have something to do with Atari selectively targeting the European and in particular German market (at the expense of the American one), apparently because they felt they could get more money here.

So half of the Atari community may actually BE German, which would well explain why an Atari news group in German (BTW, I missed the message with the name of this group) could be more prosperous than the "rest of the world" one in English; some of the rest-of-the-world citizens (did I say the French?) don't much like to speak English I've heard :-).

newsgroups: comp.sys.atari.st,comp.sys.atari.programmer,comp.emulators.misc

Hi,

as I am trying desperatly to run an emulator together with GfA3.07 I
need a TOS image 1.4 or 2.0.

I DO have an image 1.02(!) but it doesn't work with gemulator and
probably won't work with all the other emulators.

MagiC 4.00 absolutly doesn't comply with GfA3.07. Somehow the file
handling is broken, so I cannot access files properly via
fileselectbox or direct input (even though it READS the files, it
fails to list them or to detect the EOF properly :(((((

So please, is there any TOS image around? It would not be copyright
violation as I DO own an ST.

PLease help
Ronald

ps: I would need an ftp access to it . I am not used to BBSs
systems. I can offer a ftp space here, where YOU could download it too
as well.

> don't you think ?

Yes, I think exaggeration mode was on. Still I like to do something like this:
(ASCII 'Art?' mode on)

```
            ############ <---- platform to be jumped to

           __
          (''')
         /(  )\   <---- play character
           AA
   ##########      <---- platform it is standing on
```

(SCII Art mode off)

Sitation: the play character is standing on the extreme right position of the lower platform (with its right foot more or less not completely supported by the platform) and it wants to jum up to the platform above it. The two platforms are not overlapping but where the first ends the second starts. So we just jump (not moving the character to the left or right) and glory glory, the stands on the upper platform (with its left foot more or less not completely supported by the platform).

> has to be GEM, and that I am afraid is laughable, I am not excluding

Still there is the catagory GEM games and programming languages which can be used for writing those games. Arcade games are the hardest to do in GEM and you will never get the performance in GEM like you can get by going directly to the hardware. But there are more catagories of games.

> GEM, but I have not seen a good GEM game made this year written in

> supervisor stack onto the user stack and then points the SSP at the

Please, leave the user stack intact, because you can't be sure it's in use as a stack by the user program. The user program may use the stack-pointer just like any other adres register. (I frequently do so.)

Why not:

```
     movem.l    reglist,-(sp)    ; save regs
     move.l     usp,a5           ; save user stack
     moveq      #-6,d7           ; trap frame size
     cmp.l      #68010,_cpu      ; are we using an '010 or better?
     blo.s      .68k             ; nope - just a plain 68k
     subq.l     #2,d7            ; increment frame size for '010+ cpus
.68k:
     btst       #13-8,trap_sr(sp) ; check if we are called from supervisor
     beq.s      .user            ; nope - user call
     lea        trap_sr(sp,d7.w),a6 ; position of data on the stack
```

```
     move.l     a6,usp           ; user stack points at params
.user:
     ....
```

Maybe fist figure out if it was a user call or not and after that bothering about the processor type:

```
     movem.l    reglist,-(sp)     ; save registers
     btst       #13-8,trap_sr(sp) ; user call?
     move.l     usp,a5            ; save usp, so you can always restore it
     beq.s      .user
     lea        -6+trap_sr(sp),a6 ; position of data on stack
     cmp.l      #68010,_cpu       ; test processor
     blo.s      .68k
     subq.l     #2,a6             ; correct position
.68k:
     move.l     a6,usp            ; usp is now correct
.user:
```

You can't use the user stack as stack anymore, because pushing things on the stack will distroy your stackframe making a rte a call to nirvana.

Bye, Hans

Fenix does to some extent. In Supervisormode ipl-level 2 is preemptive while higher ipl-levels are not. This to avoid preemption of interupt-

handlers and maintain compatibility with MiNT applications.

I would not recommend using the spare traps for anything since Fenix is using them to speed up dispatch of kernel funtions. Using spare traps will effectivly make your programs incompatible with Fenix.

Fenix has three different library schemes ranging from shared libraries to application-to-application communication and object embedding. Applications that wants to make some of their capabilities accesible from other applications can use these schemes.

 s> This little thread came out of the BASIC thread...so should I know
 s> what a "toggle switch" is ? because I dont?

You youngsters don't need to know :)

On the earliest computers programs were entered on the engineers' console by first setting the bit pattern of the address on a bank of toggle switches then by setting the data to be entered at this address.

You really learned the value of "dry-run" de-bugging in those days! Anything to reduce the number of times you had to go through this ball-breaking procedure.

Since the problem seems to be related to magic, why don't you try using
a TOS img with Gemulator (You can put a TOS image in place of magic, it'll
work)
STonX works fine with GFA2.0, I've never tried it with 3.x, but I don't
know why it wouldn't work.

So it does. Sigh, it WAS a long time ago.

A likely culprit would be messing up the stack then doing an RTS.
Maybe the STe and STfm use different supervisor stack sizes.

 of course, so we are agreed, gem is not excluded and indeed never has
been, only you seem intent on saying it is/isn't, gem is included, but
that does not alter the plain fact that the best BASIC for making
games in 1996 is STOS...you said yourself there are other catagories,
so you cannot exclude STOS just because it doesn't use bland boring
GEM?

>No, I haven't seen any new game this year unitl we started the thread. But your

We are getting nowhere, bits of example source and ascii art and ripping my games apart go no where in your quest to try and prove that STOS is not the best BASIC for making games in 1996

>1: How do you align your screens?
>
>Screen memory has to start on a 256 byte boundary on a plain ST. I don't see
>any aligning. In omikron I would do something like:

You reserve a bank, STOS does the rest :)

```
>  Scr=memory(64256)            ' Get some memory
>  scr+=256                     ' anticipate round down
>  scr=scr and $ffff00          ' get 256 byte boundary
```

and thats the same as reserve as work 7,64256 hmmmmmmm?

```
>  repeat
>    scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate videobase
>    lpoke $ff8200,scrp         ' poke directly into hardware register

>    scr+=1280                  ' change offset
>  until(0)
```

wow, they say you cant beat the old way?....I think mine was simpler, don't you?

>2: What if banks get delete around bank 7? The memory manager of STOS will move

>the bank in memory and so your screen data will be moved, resulting in the wrong
>memory will be displayed. So will something like this work?

 your wrong, I really do wish you would stop thinking you know how
STOS works, you have no idea, I would not dream of trying to
understand your ormikron

 7 will always be the start of bank 7, no matetr how much deleting,
reserving loading or erasing you do, say bnk 7 or start(7) or whatever
and stos will go straight to it.

>
> reserve as work 6,10000

snip..wow all those pokes, and you have the cheek to suggest I may use
so many, there is not one single poke or peek in heartland,
 I have never in my life had to garbage collect, if that was an
example of your BASIC then I would strongly suggest you upgrade as
quick as possible to STOS BASIC, the days of spectrum and poking
everything are long gone you know :)

> wait vbl   ' screen should be white

 we have a command called floodpal...ho you really dont know what your
missing

 its no use banging a long line of peeks and pokes and expect someone
who is long past that sort of programming to folow it, tell me what it
was supposed to do and I will write the same code in a lot less
commands and simpler for anyone to follow,

 WHERES THE GAME THATS BETTER THAN STOS ???

                    Cheers.............!ynoT

Man, you're hard to please... :-)

I find your assessment of MiNT (incompatible? How so?) somewhat harsh, but hey, it's your mileage. Not to sound argumentative, but, for what I do, MiNT only very rarely gives me problems of any sort, and I use it almost all the time.

OK then, maybe what you are looking for is an .ACC, or maybe a combination of an ACC and a TSR. The TSR could intercept double-clicks on certain file types, and the ACC could (I presume) play the sound without taking over the video. Not being a programmer, that's about as far as I dare go.

Yves

STOS reserves memory banks on the 256-byte boundary and rouns up the
length of the reserved memory up to the next 256 bytes.

Yes it does, I just checked it! Why it works is beyond me... STOS must
have a look at what is using that bank?

The only problem is that the commandline is changed to upper case when you
retrieve it via COMMAND$. Of course in many cases this will not matter.

I am trying to discuss gameplay right now. Is the only thing on your mind this basic game better than STOS?

 > I will pass your comments on to the current testers, some of whome
 > are watching this thread and wondering what you are on about :)

Is there some garbage in the sprites like I discribed, or do have I a bad copy

of your game? I double checked the archive. All crc's are correct and still I have this garbage in the sprite when I am walking to the right.

> of course, so we are agreed, gem is not excluded and indeed never has

If you whish to uphold your statement... Yes!

> Find a hades user who wants a game, ask him the above, ask him which
> he would prefer, we both know the question and we both know the
> answer,

I know one, it's Wout Klaren, you know, the guy from the Tera Desktop. I asked him just that question. He doesn't care, as long as the game works. Shall I try heartland on his machine?

> e2-e4 is not a valid move, the move is e4 on its own as it is quite

Yes, it is. But the possibility of short notation doesn't make the same move written in long notation a invalid move, does it?

> Neither have I....And it took you 2 weeks to find a GEM game, and its
> Chess :)))) goood one Hans haha

Correction, GNU chess is a commandline game. There are GEM version, but compile the sources from the internet and you will get a commandline game. But you are right, it's another axample of a game I can compile today using C and that can't be done in STOS. Or are we going to rule out these types of games too?

What image needs to be replaced, I have a few TOS images but am unsure
what to replace. There are two files with the tos extension in the
Gemsys folder. If I could use the TOS image I'd be able to use the
emulator in English!!!!

I have many TOS images, I myself would like to use them with Gemulator.
I'll trade the Tos images for the names of the files to replace and how
to get it working with these images. :]

YES IT DOES, for crying out load!

 The difference between permanant and temp is that if you save your
basic listing, the banks will save with it if permanant,

 Reserve as screen = temporary screen
 reserve as dscreen = permanant screen
 reserve as work = temporary work area
 reserve as data = permanant work are

 Then I can also reserve as music, charactor set, 3d, sprite
 and stos will know exactly what to do with them, it will allways know
there start address and size and whatever

>think so. Does STOS automaticly alaign memory banks to 256 bytes offsets so

 yes....so there!

```
> >> Scr=memory(64256)            ' Get some memory
> >> scr+=256                     ' anticipate round down
> >> scr=scr and $ffff00          ' get 256 byte boundary
> >
> > and thats the same as reserve as work 7,64256 hmmmmmmm?
>
```

>No, only the first line is. The second and third line are to make sure my
>screens adress will be aligned to a 256 byte boundary.

 then IT IS THE SAME as all I need to do is reserve the bank and STOS
does the rest....why didnt you beleive me?

```
>
> >> repeat
> >> scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate
> >> videobase lpoke $ff8200,scrp         ' poke directly into hardware
> >> register wvbl                       ' wait for vbl
> >> scr+=1280                  ' change offset
> >> until(0)
> >
```

> > wow, they say you cant beat the old way?....I think mine was simpler,
> > don't you?
>
>Mine is faster. And speed is al you need to get good arcade games.

really, how the heck do you know ?????????????

I reserve all my banks and the rest in a routine called SETUP , the
main loop that uses speed will not have any memory being reseved etc,
you dont need that extra kick of speed until the main loop

> > 7 will always be the start of bank 7, no matetr how much deleting,
> > reserving loading or erasing you do, say bnk 7 or start(7) or
> > whatever and stos will go straight to it.
>
>STOS will, but does the hardware know? Does STOS start to move around banks in

yawn...how many times?

>As you told me I don't no how to program STOS, so I don't know how your memset
>command is called. (Probably it depends on which extension you use).

Extensions are upgrades to STOS programming launguage , just like any
other language gets upgraded, waddaya mean it depends on which
extension? stop being a baby,

> > quick as possible to STOS BASIC, the days of spectrum and poking
> > everything are long gone you know :)

>Sometimes it's still the fastest way to do things.

Sometimes ? :)

>We are not messing with palletes, we are messing with screen memory. Changing
>the pallete is not an option here. Your comments suggest you haven't the
>slightest idea where I am talking about.

Well you got that right!...I had absoloutly no idea what your list of
pokes where meant to do, we are using diferent BASICs, STOS the
upgraded 1996 BASIC, and your old one that would seem to rely on being
poked to death?

>Did you read the comments? I am allocating three memorybanks. 6,7,and 8. Bank
>number saven is used as screen memory. I fill banks 6 and 8 with zeros. I fill
>bank 7 with $ff's. But you don't have to understand poke's and peeks, STOS will,
>as poke and peek is one of the commands available in all basics.

so your long list of peeks etc that resembled an old spectrum listing
is just a round about and confusing way of :.....

reserve as (whatever type or size bank i want)
reserve as
reserve as :rem 3 banks
fill start(?) to length(?), 0...or f or whatever

> > WHERES THE GAME THATS BETTER THAN STOS ???

>
>I am trying to understand the concept of STOS memorybanks. Just out of
>curiosity, because someone said STOS memorybanks where such a great thing. Are
>you willing to help me on this subject please continue in this thread. If all

 hahaha thats a laugh, you telling me to leave a thread, hahahahaha

>questions I ask are going to be answered by shouting 'Where's the game that's
>better than STOS???' please leave this thread and I will try to find a coder
>that does know how his programming language works.

 hahahaha like you know what your talking about, your trouble is that
you are only capable of talk,
 I thought we where having an adult debate, looks like i am wrong,
every thread you have been in so far you have tried by whatever means
that you can to weasel out of putting your skills where your mouth is,

 Ok i will leave this thread with pleasure, you can stay in it and
talk to yourself until you actually win a debate, probably take you
ages hehehe

  I might see you again in the STOS debate if you ever get up enough
guts to stop talking and start proving what you say?

                    Cheers.....!ynoT

 Is there any way to make my STe think it is an FM

 I regularly use FIGGY that will make my 4meg into a half or 1 meg but

wondered if it was possible to make it think its a FM

 For software testing you see:)

Cheers.....!ynoT

First of all,

Tony: I've downloaded your games (Multi Pakman, HERO, Heartland),
and (after some trouble) I was very impressed. The look is a little
homemade, but the gameplay is very good.

What are my troubles?

- Multi Pakman & HERO doesn't run from HD.
- All three games are not full synchronised to the VBL,
  because they are unplayable with my T-28 speedup board.
  The sprites are jumping around very nervous, game control (especially
  Multi Pakman) is impossible, because it's too fast.
  If I toggle back to 8 MHz, all is OK.
- If I start the games not from ST low (I use usual ST high or better) the
  screen is trashed and the system hangs.

>the subject and will try not to talk about things I have no knowledge

>of :), seriously :)

Hhmm, I suppose there is some confusion about the OS structure of ATARIs OS?

```
       user
   GEM application    hardware independed

   VDI      AES
      GEMDOS
   BIOS     XBIOS
                      hardware dependend
      hardware

                                                  example:
BIOS:    Basic Input Output System                Rwabs - Read/Write Sectors
XBIOS:   eXtended BIOS                            Rsconf - configure serial port
GEMDOS:  GEM Disk Operating System                Dfree - Get drive free space

GEM:     Graphical Environment Manager:
            VDI - low level GEM,
            AES - high level GEM
VDI:     Virtual Device Interface                 vro_cpyfm - copy raster, opaque
AES:     Application Environment Services         wind_create - Create GEM window
```

I suppose that STOS uses only BIOS, XBIOS and GEMDOS.

The functions from the higher layers (GEMDOS, VDI, AES) are much more powerfull than the lower layers (BIOS, XBIOS).

For example:

I want to know what video hardware is present.

I can use Getrez (XBIOS 4), which return 0, which means "something like ST low"

Or I use v_opnvwk (VDI 100) which fills a array of 56 integers.

If you evaluate this array, you will get informations about the selected device (plotter, printer, screen, alternative second screen), about the resolution (width & height of the screen, width & height of each pixel, number of colors, number of pens, number of patterns, number of fonts and so on.)

Do you see the diverence?

>> >....but who the F wants a GEM game ????

>choice of something spectacular thats none GEM, I won't tell you the
>answer, I will let you work that one out,hehehe
>
> Your turn :)

Your wonderfull STOS games are not running on this nice big ataris!
Most of them have extended graphic hardware, the only access to screen
is VDI! STOS does not make use of VDI, it writes its drawings direct into
memory. This is fast, but will only work on original ATARIs (ST/STe/TT/FALCON
without extensions).
The GEM window redraw on graphic cards is many times faster than in ST low.

I wrote some applications for GEM, and yes, they are also running on a
Apple Perfoma 460 in thousands colors using MagicMac without any modifications.
Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
Hades 060 is more than 20 times faster than a 8 MHz ST.

There is no choice between GEM games and none GEM games, because you can
only run GEM games on the new powerfull atari compatible computers!

Tony: Why do you dislike GEM? Have you ever worked on a "big" atari?
(A simple falcon is not a big atari to me.)

BTW: Is there any (GEM) monopoly game around?
In case there's no one, I'm forced to write my own...

```

Does STOS know you are going to use the memory as screen memory? No, don't think so. Does STOS automaticly alaign memory banks to 256 bytes offsets so ignorant users can use it for screens? Maybe, who knows.

```
 >> Scr=memory(64256)            ' Get some memory
 >> scr+=256                     ' anticipate round down
 >> scr=scr and $ffff00          ' get 256 byte boundary
 >
 > and thats the same as reserve as work 7,64256 hmmmmmmm?
```

No, only the first line is. The second and third line are to make sure my screens adress will be aligned to a 256 byte boundary.

```
 >> repeat
 >> scrp=(scr and $ff0000) + ((scr and $ff00) shr 8) ' calculate
 >> videobase lpoke $ff8200,scrp         ' poke directly into hardware

 > understand your ormikron
```

No, I don't know how STOS works, that's what I am trying to figure out.

```
 > 7 will always be the start of bank 7, no matetr how much deleting,
 > reserving loading or erasing you do, say bnk 7 or start(7) or
 > whatever and stos will go straight to it.
```

STOS will, but does the hardware know? Does STOS start to move around banks in memory or not when you delete surrounding banks? I was told it did. But you insisting there are no problems it seems like it doesn't.

```
 >> reserve as work 6,10000
 >
 > snip..wow all those pokes, and you have the cheek to suggest I may
 > use so many, there is not one single poke or peek in heartland,
```

As you told me I don't no how to program STOS, so I don't know how your memset command is called. (Probably it depends on which extension you use).

```
 > I have never in my life had to garbage collect, if that was an
 > example of your BASIC then I would strongly suggest you upgrade as
 > quick as possible to STOS BASIC, the days of spectrum and poking
 > everything are long gone you know :)
```

Sometimes it's still the fastest way to do things.

```
 >> wait vbl           ' screen should be white
 >
 > we have a command called floodpal...ho you really dont know what your
 > missing
```

We are not messing with palletes, we are messing with screen memory. Changing the pallete is not an option here. Your comments suggest you haven't the slightest idea where I am talking about.

```
 > its no use banging a long line of peeks and pokes and expect someone
 > who is long past that sort of programming to folow it, tell me what
 > it was supposed to do and I will write the same code in a lot less
 > commands and simpler for anyone to follow,
```

Did you read the comments? I am allocating three memorybanks. 6,7,and 8. Bank number saven is used as screen memory. I fill banks 6 and 8 with zeros. I fill bank 7 with $ff's. But you don't have to understand poke's and peeks, STOS will, as poke and peek is one of the commands available in all basics.

```
 > WHERES THE GAME THATS BETTER THAN STOS ???
```

I am trying to understand the concept of STOS memorybanks. Just out of curiosity, because someone said STOS memorybanks where such a great thing. Are you willing to help me on this subject please continue in this thread. If all questions I ask are going to be answered by shouting 'Where's the game that's better than STOS???' please leave this thread and I will try to find a coder that does know how his programming language works.

Hans Wessels

 Thanks for the comments:)....the games are bound to look homemade,
they are homemade ?
 Gameplay is good? a compliment indeed, thanks:)

>What are my troubles?
>
>- Multi Pakman & HERO doesn't run from HD.

 I will presume you have not followed this thread? I have been told
its a lame excuse, but I do not own a HD, at the time of writing those
games I had no contact with anyone who owns a HD and the STOS manual
has no mention of hard drives?

>- All three games are not full synchronised to the VBL,
> because they are unplayable with my T-28 speedup board.
> The sprites are jumping around very nervous, game control (especially
> Multi Pakman) is impossible, because it's too fast.
> If I toggle back to 8 MHz, all is OK.

 Thats because they are ATARI ST games made on an ATARI ST for ATARI
STs? by that, I mean yer average ATARI ST set up,
  And before it is pointed out that I state STOS works on newer tos
versions, the games in question are older pre whatsit :)

>- If I start the games not from ST low (I use usual ST high or better) the
> screen is trashed and the system hangs.

 then in the words of Tommy Cooper...Don't do it ? :)

>>>Ok, there is something wrong with the sprite data. When walking to the right

periodically

>>
>> eh?...this is all news to me ?
>
>I can confirm this bug.

 Well I rebooted the game (something I am not used to doing, playing
my own games<G>) and still cannot see it?, I do not for one moment
dispute its there or question your comments, either of you, juts
simply to say, cannot see it ?

>Hhmm, I suppose there is some confusion about the OS structure of ATARIs OS?

 No confusion here ?

>   user
>   GEM application   hardware independed

snip...

>I suppose that STOS uses only BIOS, XBIOS and GEMDOS.

 I have absoloutly no idea if the above is true or false,

>The functions from the higher layers (GEMDOS, VDI, AES) are much more
>powerfull than the lower layers (BIOS, XBIOS).

 I have absoloutly no idea about any of that, or the bits i snipped,

>I want to know what video hardware is present.
>
>I can use Getrez (XBIOS 4), which return 0, which means "something like ST low"

 I have commands to not only find the current resolution, hertz rate
etc, but I can also switch resolutions as much as I want, and none
need any of the commands you mention, neither do I need to know
anything about xbios,gemdos or any of the others,??? I dont really see
your point? none of the words you mention have any relevance in STOS
BASIC, they are not STOS BASIC commands and as far as I am ware are
not mentioned in the STOS BASIC user manual?

>Or I use v_opnvwk (VDI 100) which fills a array of 56 integers.

 still losing me?

>If you evaluate this array, you will get informations about the selected
>device (plotter, printer, screen, alternative second screen), about the
>resolution (width & height of the screen, width & height of each pixel,
>number of colors, number of pens, number of patterns, number of fonts
>and so on.)

but I have BASIC commands for all that? simple BASIC commads that will return any or all of that information, that is the whole idea of a BASIC language, I do not need to know all the things you are mentioning, I have BASIC commands that will find it all out and return the information?

>Do you see the diverence?

NO!

>Your wonderfull STOS games are not running on this nice big ataris!

hang about, whats all this "your wonderfull stos", if you are trying to be sarcastic then this is all a waste of time :(

>Most of them have extended graphic hardware, the only access to screen
>is VDI! STOS does not make use of VDI, it writes its drawings direct into
>memory. This is fast, but will only work on original ATARIs (ST/STe/TT/FALCON
>without extensions).

without extensions? what on earth does that mean ?

>The GEM window redraw on graphic cards is many times faster than in ST low.

>I wrote some applications for GEM, and yes, they are also running on a
>Apple Perfoma 460 in thousands colors using MagicMac without any modifications.

the thread is best BASIC for games ??????? why do people have to start prattling on about applications and anything else they can think of because they are too scared to admit they cannot fault my original statement,
so far we have had demos, applications, macs, assembler, and attempts to try and make my software look bad?
Yet no one is showing me anything better

Ok I never said my games where fanatastic, I said STOS is the best BASIC for making games on the ATARI in 1996,

NO ONE has done anything to prove otherwise, you have all TALKED TALKED TALKED

None of you can show me a game written in BASIC thats better than STOS ones, it is childish to start trying to find bad things in my games, show me something better, thats the whole point, or dont you all understand ?????

>Just seen yesterday. The only difference is speed. A PowerMac 8500 or a
>Hades 060 is more than 20 times faster than a 8 MHz ST.

and your point is what ??? would it have anything to do with making games in BASIC, I think not :(

>There is no choice between GEM games and none GEM games, because you can
>only run GEM games on the new powerfull atari compatible computers!

really? I think you will find you are WRONG

>Tony: Why do you dislike GEM? Have you ever worked on a "big" atari?
> (A simple falcon is not a big atari to me.)

I have a STe...thats it, no falcon, no hard drive, i dont even have a drive B? i have the original atari mouse and a joystick and ONE box of disks, thats my total atari set up, I manage to make reasonably good software thats quite well recieved in the ATARI community, beleive me its not that easy with such a bare minimum set up,
SO no i havent "worked" on a big atari, in my book this is big:)

BTW my software is free, its not work, its a hobby ?

I spent sooo long using programs that are none gem, a few years, (on the atari) then when i had to use the desktop ie: when i got a modem, i suddenly had to start using gem...what a let down,

why do all gem programmers think there is only red,green white and black, surely they can change the colours here and there, I have made some serious software in medium rez, and they "look" quite nice, I made angled scroll bars with shape and depth, 3d boxes etc,
Nagggh I definatly dont like GEM its boring IMHO:)

>BTW: Is there any (GEM) monopoly game around?
> In case there's no one, I'm forced to write my own...

in BASIC ? :)

Cheers.....!ynoT

Hi, I am looking for the same thing (TOS image). It seems that
Gemulator doesn't work with my dumped TOS 1.0 image.
  (I have a very old 1040st)

so if you get an image please email it to me, or perhaps let me know
where to obtain an image ...
thank you.

Replace the MAGIC_PC.OS file in your root directory. It's not in the GEMSYS
folder.

You don't need ST-Guide... what you need is just a normal editor. Of course
you will not see the graphics in the editor. For those, you need a HTML
authoring program, AFAIK, Atari don't have one.

I suggest you grab a HTML document to make yourself familiar with that
language if you are using a normal editor. Just go to Yahoo & search "HTML"
for where to get the online doc.

Regard
William

Have you tried TOS.LO TOS.HI ? Can't be sure if it works, but I've
came accross with such names with TOS 2.06 files.

Do you mean completely without screen display - even GEM based? I have
SuperSAM set up so that it plays .AVR, .WAV and other sample formats. It
just plays the sample given then quits. If there is an error (unsupported
frequency etc.) it simply gives a GEM alert telling you this.

Surely this is a good thing, rather than doing nothing?

I haven't checked what midifp does... (I dont have any .MID files)

(if you want, I'll write a 10 line C program to play any .AVR sample via
 SAM with zero screen writing...)

Yes, I believe you are right. I think you can use FForce() to redirect
stdio to any file handle. Not sure, as I have never used it...

....but I can safely say that I (like many Falcon owners) very rarely run
ST games for the simple reason that they look/sound pathetic compared to
Falcon equivilents. Appart from Falcon-testing heartland and a few other
games, I haven't *played* an ST game on my Falcon/FX for at least 6 months.

Yes, people like to play games, but if they can afford a 2/3000ukp Hades,
then I am sure they can afford an ST if they are desperate?

For more compatiblity one could install an AV manager of some sort as viewer
for *.* in DESKTOP.INF. You'd have to have an accessory with which it could
communicate and which could play a file. Only one problem: the manager
program whould take up the screen display for a second or two...

Does anyone know if it is possible to wait for _both_ mouse buttons in one
GEM event. And I _don't_ mean both buttons _together_, I mean the left
button OR the right button... (binary OR in this case :-)

Darn right - that's why I don't use a DOS box as my persoanl machine

>I find your assessment of MiNT (incompatible? How so?) somewhat
>harsh, but hey, it's your mileage. Not to sound argumentative,

It's not a matter of harsh, it's a matter of practicality. If I could get MiNT to work properly (or, more accurately, if I could get Jetmail to work properly, unattended, under MiNT) I'd be quite pleased to convert.

>but, for what I do, MiNT only very rarely gives me problems of
>any sort, and I use it almost all the time.

You're not running an autoamted mailer, are you?

>OK then, maybe what you are looking for is an .ACC, or maybe a

>double-clicks on certain file types, and the ACC could (I
>presume) play the sound without taking over the video. Not being
>a programmer, that's about as far as I dare go.

That would be a good solution - I'd say a CPX rather than an ACC, since after all, there are only so many ACC slots, but the TSR/ACC option works well for STiK.

So, the concept has developed to this point:

A TSR will load up and create a cookie.

Appropriate CPXes will load up and communicate with the TSR somehow, possibly by adding more cookies.

When an unknown filetype is double-clicked, the TSR Will check to see if it's a "known" type and, if so, pass it to the correct CPX; if not, drop to the usual desktop routines.

Now the problem is finding someone who thinks it's worthwhile to program.

But that's exactly what I want to get away from, Lev. When running CAB, for
example, when I click a link to a WAV file, I just want to hear the WAV, not
see a blank screen (or even a description of the data) while it plays. ATM,
clicking a WAV link leads to a complete redraw of the page after SWAV plays
the sound.

Absolutely without screen display. An alert box if there's a problem is acceptable IF and ONLY if it times out and goes away by itself after a few seconds.

>SuperSAM set up so that it plays .AVR, .WAV and other sample formats. It
>just plays the sample given then quits. If there is an error (unsupported

That would be good. Someplace around the house I have C source for a WAV player - it need some work (doesn't handle stereo samples properly, for one thing) but it would be another approach - if I knew enough C to do anything useful with it. Guess that's my next project after the UUpoint gateway - learning C properly. <SIGH> It never ends.

Ah, the docs start to get scarce round about here!

>My understanding is that I have to define a MFDB for the memory with
>one single long line

Can't remember exactly but it sounds right.

>(and appropriate pxyarray), with mode 0, then call
>   vr_trnfm(handle, psrcMFDB, pdesMFDB)

You don't need to worry about this function. It's for converting
images to and from a standard format which VDI on all system
understands.

>What little docs I have implies that, copying from memory to screen,
>the mode will be toggled and placed in the destination mode. This does
>not happen. I realise I fail to understand what vr_trnfm is actually
>supposed to do to what.

I wrote some code which I've been using successfully for years (that's
why I can't remember the details). I'll post it here.

>When I go on to call vro_cpyfm, to copy from memory (all set to 0x5555, to
>give grey) to the screen, I get a single line where I expect to copy to,
>and the top of the screen few rasters (in the menu bar) goes grey.

The scheme I used works well and I've not had any reports of it
failing under any resolution. It'll be a uu-encoded zip.

No, wrong there. Setting fd_addr to 0 will indeed cause the MFDB to
reffer to the screen (I use it all over the place in the XaAES code).

Hi All, esp Tony :)

I was wondering if STOS is still available commercially - if so, where from.
Anyone in the UK ?

Cheers,

Anyone know exactly how much it costs now? I'm using the cover-disk release of Devpac 2 ATM, so I'm tempted to upgrade. Oh to have a proper manual, what luxury! :)

Hi all,

I am having a problem with a program I have written, on an Atari STfm (1/2 meg) it crashes at a seemingly random point for no reason I can find. The error is two bombs : bus error, poke or peek possibly wrong. The same thing does not happen on an Atari STe. Is there a reason for this error that I can program around? Any help or ideas would be much appreciated. Cheers

Dan Jones.

well, you should do really. A toggle switch is just an on/off switch.

(it 'toggles' between two states). A light switch is a toggle switch.

In this context, they mean really old computers (like the ones built
here with the really clever naming scheme... Manchester Mk1, Mk2...)
which were programmed by setting the binary values in the memory
directly by entering the numbers into a bank of toggle switches...
A tiny bit more complex to program that STOS... :)

Anthony

 lame! lame, you call me lame when you cannot even back up anything
you are trying to say?, I made a statement and backed it up with

software to prove it, you have done nothing but talk, ho and show me a demo that had nothing to do with making games, show me something that has something to do with the thread, THEN and only THEN, may you resort to insulting me

my excuse was that I did not have one, ie a hd, or have any documentation and no way of getting it, OK!

>that has to be in the current directory and you don't have to bother where your
>files are located (on disk, harddisk, networkdrive or maybe even on tape). As

You put heartland on your hardisk and it worked, so you know that I already work like this, its called learning, no one makes a something perfect first time, heartland is my latest release and works from hard drive, and we all know that you already tested it, so why try to look clever telling me how to do something that you know I have done already ???????????

>Other reasons: smaller risk of loosing data, faster copying, less slack space
>on the medium, better compressable.

bollox, your doing it again...talkin bollox, no one ever lost data from any of my games, theres no good reason tyo put all the files into one file, theres no reason why not to have them anywhere I want ?

AGAIN the person playing the game and enjoying himself, is not going to worry about how the disk is made up,

Wouldn't it be nice if the demo you sent me did not have loads of different programs on it, then your explanation would not have looked so silly, had you practised what you preach ????

Cheers.....!ynoT

Hang on, didn't I just answer this thread, you are duping your
posting Hans :)

>(from the OS's viewpoint). Just don't insist of getting data from drive a and
>don't use a absolute path. An other solution was discussed somewhere else.

You already know I can do this, because you ran heartland from your
hard drive, so please stop trying to show off,
BTW I also said I had no documentation no hd and no contacts with
one, I have since learnt, or are you suggesting that everyone that
releases something should make it perfect on the first go ?

> > would have been changed, its not bad programming IMHO but a bad
> > choice of gameplay?...Yes?
>
>A bad choise of gameplay enforced by the limitations of the used language?

Ho dear, why make statements you cannot back up ?
I made a decision to stop the game, I could have let player two
continue, but I wanted both players to see what decision was being
made, ie: wether they where going to lose something from the other
players choice, it was my descision, NOT a limitation?

> > that's utter crap!, you make the game sound rediculous, it is nothing

> - the left food isn't standing on the platform, the
> sprite does fall down.

draw all you want, you are trying to tell everyone that the sprite in
heartland gives a false sense of being able to stand in mid air and
not fall when it should, and actually stands somewhere but falls, that
is an utter falsehood, it is nothing like you say, why do you feel the
need to attack sofware like this?

Has anyone played Heartland, would you say it is bad detection, is it
really as crap as Hans wants everyone to believe ? I tell you what
Hans, if Heartland is that bad, if its as sad as you are trying to
make out, then its time for me to pack up,

>I am calling the fact that the sprite does fall down in the left

>situation a bug in the program. It shouldn't be that way.

 sheeesh .it does not happen the way you are making it out, I dont
mind critism at all,in fact I welcome the feedback, it helps to make
the next game better, but you are trying to make out that the sprite
when on the right hangs in mid air, and when left it falls off when it
should not,

> > The thread is...STOS is the best BASIC programming language for
> > making games in 1996, and I added C to the equation just to make the
> > point,
>
>Still you didn't mention anything about writing GEM games in STOS. So I say:

 Thats because it is irrelevant,

>STOS basic is totally useless for writing GEM games and so it is NOT the best

 Ho I agree totally, STOS can NOT access GEM, even though you state in
this newsgroup that I use GEM calls ?,

>basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the
>best basic for making games, because those basics allow you to write GEM games.

 hahahahahahaha yes I agree anything is better than STOS for making
GEM games.....but who the F wants a GEM game ????

 I can show you a good game written in 1996 in STOS BASIC, you show me
one in GFA, HISOFT or OMIKRON and you win, in other words back up your
statement, I DID ?

 Knowing the programming language would help, and believe me, it may
seem random, but won't be, no matter what language ? :)

>Anyone in the UK ?

 OK, STOS is no longer supported by the original authors, they are
busy making Klick'n'Play and followups on the PC, the people who own
the selling rights to STOS have absoloutly no InteresT in the product
and according to an email I recieved from them, they say they would
not be interested in anything to do with STOS or be able to find the
time to deal with any matters arrising from STOS , That was a response
after I asked if anyone would mind me sending out copies FREE of
charge and unchanged, so..?

 STOS was released on a cover disk ST Format? cant recall the issue,
but its in the STOS.FAQ, Ad-Lib BBS (Sysop Frank Charlton ex ST Format
STOS Answers), they have a file site that contains all the softwrae
from ex cover disks, so you should be able to get a copy from there?

 Otherwise such publications as MicroMart usually have adverts for
used ATARI stuff :)

 BEFORE anyone jumps in with there size nines!..STOS is supported by
independant software developers, there is no need for the original
authors, STOS was made in such a way that it is simple for extra
commands to be added onto the launguage, there are now many such
upgrades, including Falcon specific stuff :)

 Please see the STOS FAQ for more info :)

Cheers.....!ynoT

I think it would be quite easy - if you make use of existing software.

There was a program on an ST-Format coverdisk called 'what-is' IIRC, which identifies a file (by reading the header - not just the file extension) and introduced a protocol for programs to comunicate with it.

You could write a simple little application to replace the standard viewer which asked What-Is what the file was, and then called the appropriate external program - eg. Midifp for .MID, Play-avr for .AVR etc. If 'What-is' returns 'unknown file' simply display a dialogue informing the user that it is not a recognised file, asking the user what to do (display as text, abandon, select viewer application...)

These programs do not write to the screen (well, they may do, but it is relevent - not just the contents of the file) - I dont see the problem here. There is no real need for What-is, but this just makes it a bit more sophisticated.

Ideally, I think replacement desktops should also understand this protocol so that there was no need for the above app - just interigate What-Is directly. This would improve the install application facilities of these desktops.

 OK, I will bow to your experience on this, I neither own or have
access to anything other than a standard STe, it was an assumption
that someone upgrading there machine would not want software from
there old machines they obviously wanted to get away from, it would
seem they have no choice?

> > Dunno about Highsoft, I am having real trouble finding more than a

 waddaya mean "Again wrong" :)
 Yes I am speaking about the English speaking community because thats

the only community I know, perhaps I should keep mentioning English
speaking in every sentance?...you seem to be overly pre-occupied with
this english speaking side of things?, whats wrong?

>some sort of public domain disk lets have a look a the ST Computer public domain
>pages (ST computer is a German Magazine):

My appologies, I presumed everyone knew what a PDL is, it would seem
that you do not, a PDL is a Public Domain Library, sorry for confusing
you with the technical terminology ie: PDL

>- Don't wory, be happy!, Gem version of ludo
>- Nanjing, Gem game (Acc or program)
>- Sokoban, Gem version of sokoban.
>- Invers, Gem game..
>and so on..

ok point taken, UK PDL are packed to the gills with STOS written
programs, not the rest of the world, I AM WRONG then :)

>The april 1995 edition has ten new disks, 4 of them containing Gem games, I am
>realy wondering how much of those games where written in STOS (none I think),

ok ok I said I was wrong :)

I already knew the answer, the idea was for people to come forward and
show that there BASIC is better for making games, something you have
fantastically failed to do :)

>Omikron basic is vs 5.02 from 19-05-1996. It's now running on the MagiC OS too
>(Mgic, MagiC Mac, MagiC PC). So you can program your games on those OS's and
>they will work on those OS's (unless you choose to use computer specific
>features, like DMA sound, our direct acces to special hardware registers..).

It was a honest question, I did not know, I am suitably impressed,
enough so to ask (serious question) if there is English speaking
documentation, manual, or a demo maybe?, where is it available and
prices maybe? if you don't mind me asking ,:)

>What about STOS updates? Which is the old basic?

> > And I take it all the messages are in German?....personally I would

>Ofcourse, it's a German newsgroup. Stunning, a bunch of german Atari users are
>cabable of producing more messages than the english speaking 'the rest of the
>world'.

 I already agreed, and agree again, I really do wish there was a lot
more messages in the comp.sys newsgroups ?

> >>Again the difference, the emulator is called Magic (Mac/PC) and is

Tony, XBIOS isn't part of GEM - thats AES/VDI. The Xbios *can* be accessed
from STOS via the 'trap' command (trap 14,...). Despite this, I doubt that
Tony is the one using Xbios - it is either extensions (eg my Falcon extension
sometimes uses this to change resolution - dependent on the STOS programmers
wishes, of course) or the original STOS commands.

It was the fact that it required the program to be in the root directory -
not on floppy disk - that caused the problems. As you are unlikely to keep
a disk-sized game in a sub-directory on a floppy disk, this problem was not
encountered on floppy based systems.

(try running Hero from the root directory, and it will work from HD...)

>>(from the OS's viewpoint). Just don't insist of getting data from drive a and

hehehe.... yes, a simple leading \ is all that problem was... And how many
HD owners made Tony aware of this limitation?

> Has anyone played Heartland, would you say it is bad detection, is it
>really as crap as Hans wants everyone to believe ? I tell you what

Nope. I would say that heartland is a great game, and I didn't notice
any such problems.

>Hans, if Heartland is that bad, if its as sad as you are trying to
>make out, then its time for me to pack up,

Nope. Judging by the comments of gamers in c.s.a.st when Heartland was
released, I would say that Hans is in the minority on this one...

>>basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the
>>best basic for making games, because those basics allow you to write GEM games.
>
> hahahahahahaha yes I agree anything is better than STOS for making
>GEM games.....but who the F wants a GEM game ????

Yes - would anyone here honestly say that the best game they ever played

was written in GEM? If not, then surely a programming language which doesn't support GEM may still be the best for games, even though it doesn't support it?

> I can show you a good game written in 1996 in STOS BASIC, you show me
>one in GFA, HISOFT or OMIKRON and you win, in other words back up your
>statement, I DID ?

hehhee... lets tear appart a GEM game. I bet most of them run in more than 2 vbls per screen update... :)

The only real problem with that is that it requires MiNT. I'm looking for a
way to extend singleTOS - MiNT has so many incompatabilities that it totally
defeats the purpose of having it installed for me.

The problem is that writing to the screen is NOT relevant. IF there's a problem with the data file, I'd rather have no results at all, or a log file written out - the whole purpose here is to play data files WITHOUT screen display.

Need input!

We can't troubleshoot unless you tell us:

(a) what language is it written in;

(b) how much RAM does it allocate to itself;

(c) can you turn on TRACE and determine at what point(s) it is actually
blowing up?

A copy of the source might also help, if it's not too large.

OK, I'll bite. HOW is it done? Keep in mind that, due to the nature of
MIDIcom, I need to use GEM programs (TOS apps disconnect the network); I
haven't found a way to init a GEM app without it grabbing the screen.

>You don't have to get the "usual messages". It's entirely just what
>messages the programmer puts into the program. Just the same way as a TSR
>could have various messages.

I can compile a program that doesn't print ANYTING to the screen - it still
creates the app name above the menu bar, and a blank display.

>Using a TSR will not solve the problem.
>
>Using a program that does not output to the screen, be it TSR or not, will
>solve the problem.

Two seperate problems - non-display is needed, and a TSR is prefereable
becasue, even on a fast hard drive, there is significant delay loading an
app on an 8 MHz system.

>I presume you have a hard disc drive, in which case software generally

>loads quite quickly anyway.

"Fast" != "fast enough" in this case.

>Alternatively, you could just set all your file viewing software to load at
>startup so that the desktop passes files to them by the AV protocol. This
>way you don't have to wait for the software to load, since it is loaded all
>the time.

Precisely what I had in mind.

What version of NVDI do I need or is there a program I can run in
the auto folder to give me control back. None of the cpxs etc. do
anything. The ICD booter 6.4.3 gives me the right colors when I get
to the desktop. I am guessing because it sets the screen rez for
the boot. HDDriver 60 does not.

George

 ooer, I stand corrected (again?), But then again..mo now knowing that
much would surely prove that I didn't use them :))

>Tony is the one using Xbios - it is either extensions (eg my Falcon extension
>sometimes uses this to change resolution - dependent on the STOS programmers
>wishes, of course) or the original STOS commands.

 Hmmm I haven't used the Falcon extension...mostly just the Missing
Link?

>(try running Hero from the root directory, and it will work from HD...)

 Well theresa another one to me...shame it was an accidental one, I
never knew that :)

>> You already know I can do this, because you ran heartland from your
>>hard drive, so please stop trying to show off,
>
>hehehe.... yes, a simple leading \ is all that problem was... And how many
>HD owners made Tony aware of this limitation?

 One...:) IIRC , and I do recall asking you if it was really that
simple:)...wish I had a HD....thats just under the wish I had a Falcon
wish?, Get the Falc and I will have a HD..ooer :)

>> Has anyone played Heartland, would you say it is bad detection, is it
>>really as crap as Hans wants everyone to believe ? I tell you what

>Nope. I would say that heartland is a great game, and I didn't notice
>any such problems.

 no neither did any of the game testers who had it for around a month
or more before release, I am pretty sure they would have mentioned the
little chap either hanging in mid air or "a programming bug" that made
him fall off ledges he was stood on,
 Maybe I should sack the playtesters (only kidding gang<grin>)

>>Hans, if Heartland is that bad, if its as sad as you are trying to
>>make out, then its time for me to pack up,

>Nope. Judging by the comments of gamers in c.s.a.st when Heartland was
>released, I would say that Hans is in the minority on this one...

I got an excellent response from Heartland, maybe because we insisted in the documentation that the only way we would continue making FREE software was to get encouragement, I got loads of emails, but now that the game has filtered through to the PD libraries catalogues we are starting to receive snail mail with very good comments, honest we are!
Yet no one has mentioned dodgy sprite detection?

>>>basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the
>>>best basic for making games, because those basics allow you to write GEM games.
>>
>> hahahahahahaha yes I agree anything is better than STOS for making
>>GEM games.....but who the F wants a GEM game ????

At this point I was getting rather wound up, but still managed to keep it to one capitol letter :)

>> I can show you a good game written in 1996 in STOS BASIC, you show me
>>one in GFA, HISOFT or OMIKRON and you win, in other words back up your
>>statement, I DID ?
>
>hehhee... lets tear appart a GEM game. I bet most of them run in more than
>2 vbls per screen update... :)

I think the problem some people have <ahem!> is that they are viewing the game, and other STOS written software, from a programmers point of view, this is all well and good in a programming forum, but when commenting on the viability of a game, ie: its usefulness as a game, then it should be viewed from a players point of view,
The person sat at home with his telly and ST playing a game, if he is enjoying it then he wont complain how many vbls it took to update the screen or what language its in, or where the files are stored, he wont mind not being able to multi task or render some artwork or whatever while he is playing, a full good game should keep him happy,
I say STOS is the best BASIC to achieve this task...

And I am still waiting for someone to prove me wrong ? with something a little more tangible than talk...ho and ascii drawings :)

Cheers.....!ynoT

I have a small box of atari books and software I'd like to
give away to anyone who wants to come pick them up.

Cmanship complete, trb aes & vdi quick refrence, old copy
of devpack with manual, cad3d, Gogo st, and some other
stuff.

If you are near Shingle Springs, CA and can come pick
them up send me email. Otherwise I'm going to toss
them in the trash.

>routine.
>Is this normal, or what?

The reason for this is, that the compiled code does use some CPU
registers, which are *NOT* saved and restored before and after your
assembly code. So all you have to do is to save and restore the
registers that your routine uses. You can do this inside your code or
use a compiler option.
Sorry: I have forgotten which registers are critical and how the

compiler option is called.

D > The error is two bombs : bus error, poke or peek possibly
D > wrong. The same thing does not happen on an Atari STe.

Unless you have modified your Ste to use a 68030, I probably can't help you. I used to get 2 bomb errors when I tried to run programs on a ST which I had developed on my TT. The problem there had to do with setting int or long pointers to odd valued addresses.

Specifically, I was creating a file header which included a string. When the string was an odd number of bytes long, the rest of the header was mis-aligned in RAM.

To be exact:
Bus error: you tried to acces (read or write) memory on which you haven't acces rights. In supervisor mode this can only be non existing memory. In user mode it also can be acces to the hardware registers or memory below the adres $800.

> wrong. The same thing does not happen on an Atari STe. Is there a
> reason for this error that I can program around? Any help or ideas
> would be much appreciated. Cheers

As the program works on a Atari STe. You try either to read or write STe specific hardware registers, or, because your STfm has only half a meg memory, you tried to read or write above the 512 kB border.

Maybe you should put print statements around every construction that's allocating memory:

```
print "Start of memory allocation"
'Allocate your memory here
print "Memory allocation was succesfull!"
```

Same thing around statements where you are accessing memory blocks you haven't used before.

Hope this helps, Hans Wessels

> > ?

Yes, if you are keeping data on a single disk changes of loosing data are low. But there are also people how are keeping their data on harddisk, packed or depacked. If someone on the computer club is asking me about a certain program, I might say "It there and there on my harddisk, copy it yourself.." and data gets lost very quickly. Less folders and data files means simply lower change of any data getting lost in the process of archiving, copying, rearchiving, datatransfers etc.

Copying from harddisk to disk is faster when there are a few big files. Same is true for loading data from disk while starting the game (although the speed advantage is very small).

A few big files generate less slackspace then a lot off small files. Especially on big harddisks like mine (big cluster size is the problem).

And yes, on big file is better compressable as serveral small files.

> > Wouldn't it be nice if the demo you sent me did not have loads of
> > different programs on it, then your explanation would not have looked
> > so silly, had you practised what you preach ????

All the data the inividual demoscreens need are in the program file. Except for the digisound table and data, because those files are used by multiple programs. Every executable is a working program on it's own, except for the loader which binds all programms together in one demo. So I think I have indeed practised what I preach. I even delivered a textfile with the scrolltext stories, so you haven't to hack into the programs just to read them in your own tempo.

Cu, Hans

Indeed. The number of games making use of the special abilities of a certain power machine is very low and probably zero, because there is more variety in the hardware. Normal ST(e)'s are a nice standard, but even on a falcon you can't be sure about the bus and processor speed.

Nothing, but at the moment you are going to make general statements like you
did, you have to be sure it will hold for the whole Atari community.

> and show that there BASIC is better for making games, something you
> have fantastically failed to do :)

I am trying to catch some German game enthusiats so they can update me about
new games written in serveral languages but there is still no answer from them.
I'll keep you informed on this point.

No, there is only a German adress in the review. But I think it German only,
just like 3.5, the last update I have.

You *can* use STOS memory banks for holding the physical screen... you just tell the hardware to point to it! STOS memory banks are a must for holding extended screen modes (32000 bytes). They *do* work like this, I have used this method on the Falcon in 320*264 resolution and there are no problems whatsoever! And I don't tell stos "use bank 7 for physic", I just set the hardware to point to the start of the bank or half way through (I reserve twice the needed size to have a buffer).

From: "Ronald Hartwig" <Ronald.Hartwig@Informatik.Uni-Oldenburg.DE>
Subject: Need working(!) ST Emulator for GfA3.07D program
Date: 1996/11/22

Message-ID: <572v9r$emi@news.Informatik.Uni-Oldenburg.DE>#1/1
X-Deja-AN: 197964309

organization: C. v. Ossietzky Universitaet Oldenburg - Fachbereich Informatik
newsgroups: comp.sys.atari.programmer,comp.sys.atari.st,comp.emulators.misc

Hi,

I am really desperatly searching an emulator for PCs which emulates
my 1040STFM with TOS 1.4 (I thin) or 1.2.

Up to now I tried several:

```
MagicPC (full version)  : problems with fileselectboxes (*)
MagicPC (demo)          : No use, due to disc only file access
Gemulator96 (demo, with MagicPC Magic_OS 1.0 96/6/26):
                       same problems as MagicPC full version
```

STonX   : Is known not to run GfA3.x
Tos2Win   : Did not run (Page fault under W95)
ST??? (som efrench emulator, from the comp.emulators.fawq):
               The address was inactive (No files there , no
               mail reply but a timeout sending mail!)

(*) the problems seems to depend on MagiC. As long as I use Magixdesk
I can access all data from the desktop. But when I switch to GfA Basic
and try to load a file, th eselectboxes stay empty. Nevertheless I may
load a program when I type th ename blindly. But then GfA behaves bad
when trying to load a file. (sometimes it works, but mostly it
doesent). Using Gemini1.999(!) as a replacement makes it even worse,
as gemini is not able to open any drives ("Error: fgetinfo failed").
Using the supllied shell tells me: "Not enough memory to open
"<unreadable sign> but this cannot be th ecase (16M, 1,2G HD)

So please, has anyone an idea how to continue??

Please suggest help to
Ronald

ps1: I use W95 and Linux, so both platform solutions will be welcome.

I am realy sorry, but I just see it like that. When I am standing on a platform and there is some platform free on the left side of the character, so my red liquid powered processor concludes he can savely direct the figure a bit to the left and, surprice surprice, the character falls down! I don't expect Rick Dangerous quality of character control, but I think game play would be better if it would be fixed.

> sheeesh .it does not happen the way you are making it out, I dont
> mind critism at all,in fact I welcome the feedback, it helps to make

Ok, there is something wrong with the sprite data. When walking to the right against a blue background a white pixel infront op the character is periodically visible. When you walk against a wall and keep moving you can se some data in the face is distorted and also some junk data in the wall is (periodically) visible. (The data is already distorted in the sprite buffers you use.) Just to be sure, it doesn't make game play bad, nor does it say anything about the used programming language, it's just a minor flaw.

The Falcon's blitter in Hog mode is quite fast. However, you cannot have
any interrupts running that occuply alot of CPU time or it seems that uses
the DSP, like a MOD player. I have an engine that I used on the Falcon
for Towers II. If you wish, I could put it somewere you can look at it.

I also have some code for blitting in TC mode with the Blitter, but I don't
recall where it is.

There's not a lot I can say without more info! What language? What are you programming? Does it access hardware? Was it written on the STE originally? Is the cpu in userstate - if not can peek/poke cope (some can't)?

You can't program around a bus error as such. You need to find it. Once found, the reason and thus the solution will usually be obvious.

If you have no access to a debugger (and they aren't much use imo) then there's nowt like a few good old print statements to find out. I always use the binary chop method when I'm completely flummuxed (or too darn lazy)!

It may seem random, but it isn't....

>find. The error is two bombs : bus error, poke or peek possibly wrong.
>The same thing does not happen on an Atari STe. Is there a reason for
>this error that I can program around? Any help or ideas would be much
>appreciated. Cheers

We are going to need more detail than that, I expect...

I guess from the words 'poke' and 'peek' that its Basic. GFA, IIRC?

What does the program do? does it use any interupt based routines? (eg. sample players, joystick / mouse reading, mod players etc.) as these are likely to cause bus errors if you do nasty things to them.

I assume you are not changing any hardware reg's. with peek/poke?

Try removing sections of your program (comment them out) and see if you can stop it from happening. Then re-introduce bits one at a time, until it starts to happen again. You will then have tracked down *part* of the problem...

Hope this is of some help...

Anthony

It all comes down to the definition of 'best'. From your previous remarks about
Tony's games (eg. no. of VBL's per game-loop) I made the assumption that one of
your criteria for a good game is one which is fast, updates the screen smoothly
etc.
This is not what you get with a GEM based game.

If your definition of 'best' means that this is of no consequence, why mention

the VBL figures. Also, if following this line of reasoning, a demo would be
of no use as proof either way, as all this is showing is the speed of execution.

Anthony

(btw. if you try 'francais' into the STOS editor, it all turns into French,
 so it certainly isn't just for English programmers! - and also, most
 computer terminology is multi-lingual as it was invented WAY after the
 languages had formed...)

If all these other languages are so good then why do we not see many programs
released today written in them ?? Why is it so many good STOS games come out?
When did the last Gem C platformer come out ??
(Incidently if anyones got loadrunner for gem or not I would love a copy :-))
There was super tetris in GFA recently but that's all I think ???
I have Hisoft Basic 1 and it is an excellent package but haven't seen anything
written it..

To move the thread on slightly are we seeing the demise of game programming on the
ST?? <Cue several replies from the STOS mailing list!>

agape,
Davy

To be honest, yes. I think that the games scene is shrinking, and this is why we are seeing less games - in any language. The vast ammounts of time needed to write a good game are thought of as not worth while with the shrinking user base which is
why we dont see all that many games written in pure asm. these days...

Having said that, there was enough negative feedback to convince Tony not to start doing edu. stuff and to do heartland/dimond-ice instead, so it cannot be /that/ dead.

> <Cue several replies from the STOS mailing list!>

hehehe... I was almost tempted NOT to reply. :)

Subject: Bulletproof TRAP handler? (long)
Date: 1996/11/22
Message-ID: <b177cc$21b1.2bf@HERMES>#1/1
X-Deja-AN: 198067325
newsgroups: comp.sys.atari.programmer

Does anyone have some 68k assembly source for a bulletproof trap handler that can be called from either user or supervisor mode?

I want to extend my Toolbox TSR (which is called via one of the Atari's 12 unused TRAP vectors) to allow it to be called from Supervisor mode as well as User mode, but the code I have written seems to be far from ideal. (Or am I being a bit too picky?)

Originally, it was callable from User mode, and expected function code and arguments on the 68k User stack, and the called function would receive the arguments as if they had just been JSR'd directly by the calling app.

That limitation (only callable from User mode) was due to my need to rewrite something like 2000+ lines (in 68k assembly) of Toolbox code in 24 hours after a power supply meltdown a while ago (in my TT) cost me my hard-drive and the data on it (read: it occurred two hours prior to a scheduled backup). It was easier to implement it that way than to generify it to allow calling from anywhere.

A few people have expressed interest in using the TSR with their own progs, so I would like to generify the handler so it can be called from anywhere.

At present, my (very inelegant) implementation, after detecting it has been called from supervisor mode, copies six longwords from the supervisor stack onto the user stack and then points the SSP at the data prior to JSRing to the called function. (This way the saved registers and trap frame [on the supervisor stack] are preserved).

However, this implementation feels very inelegant, and will definitely cause problems with called functions needing more than six longwords of parameters. AFAICR, none of my code requires more than 20 bytes (5 longwords) of params, but I could be wrong on that point, though.

A further complication is that the TSR is extensible, and so extension modules loaded at boot time (for such things as bitmap expansion of an

image, disc editing tools, and suchlike) may be called. This is all handled (faultlessly) in the code which disambiguates the function number.

I can't guarantee the re-entrancy of the code, though. (BTW: Are there any OS's for the Atari which allow pre-emption when in supervisor mode?)

Here is (roughly) what my code looks like in Devpac 3.1:

(BTW: I am doing this from memory - I don't have the source code handy, as I am running my TT in monotasking mode as Connect 2.46 is somewhat more reliable when monotasked than my usual Mint 1.14/AES 4.1 multitos setup)

```
; "is it a toolbox call" has run, and it has determined that
; it is a genuine Toolbox call. It then branches to this

     movem.l  reglist,-(sp) ; save regs
     move.l   usp,a5        ; save user stack
     move.l   usp,a6        ; get user stack
     moveq    #6,d7         ; trap frame size
     cmp.l    #68010,_cpu   ; are we using an '010 or better?
     blo.s    .68k     ; nope - just a plain 68k
     addq.w   #2,d7         ; increment frame size for '010+ cpus
.68k btst #13-8,trap_sr(sp) ; check if we are called from supervisor
     beq.s    .user         ; nope - user call
     move.l   trap_sr+24(sp,d7.w),-(a6) ; copy param #6 to user stack
     move.l   trap_sr+20(sp,d7.w),-(a6) ; copy param #5
     ...
     move.l   trap_sr+4(sp,d7.w),-(a6)  ; copy param #1
     move.l   trap_sr+0(sp,d7.w),-(a6)  ; copy function number
     move.l   a6,usp        ; point user stack at params
.user

     ; disambiguate function number (at address pointed to by USP)

     ; a4 will now contain address of function that will be called

     move.l   (a6)+,a3  ; lose function number from stack frame
     exg  a6,sp         ; save SSP in a6, point SSP at params
     jsr  (a4)     ; call function
     exg  a6,sp         ; restore SSP
     move.l   a3,-(a6)  ; restore function num in stack frame
     move.l   a5,usp        ; restore USP
     movem.l  (sp)+,reglist ; restore saved regs
     rte           ; return to caller
```

A typical call to the Toolbox is as follows:

```
tlbxProcessor:
     pea  buffer        ; buffer to be filled in with CPU, FPU
     move.l   #$430,-(a7)   ; function number
     moveq    #0,d0         ; interface
```

```
     moveq    #$10,d1       ; interface (MAGIC number)
     move.l   d0,a0         ; interface
     move.l   d0,a1         ; interface
     trap #0       ; call toolbox
     addq.w   #8,a7         ; fix stack
```

(The Toolbox call interface requires d0,a0,and a1 to be zero, and d1 to be $10. I sort-of had ideas for the zeroed registers when I designed the Toolbox interface, and am still mulling over which variant will succeed and become the newer interface)

In this case, "buffer" will be filled in with the CPU and FPU installed in the computer.

Having this function in the TSR allows me to have one call in my app which can interrogate the computers processors, regardless of TOS version, and free of the "incorrectly programmed FPU cookie" bug in all versions of TOS 3.x and 4.x that I am familiar with (in essence TOS programs it to say "there's one there, but I can't work out which FPU it is"). As a side effect, depending on the software you use, the system speeds up by about 5-to-10 percent when the FPU cookie is correctly programmed.

I would very very much like to program a Falcon, I don't mean make things compatable, I mean actually get to grips with the extras and make something that needs maybe 3-4meg of memory and lots of hd, something spectacular....

> > this english speaking side of things?, whats wrong?

I think we all have to make acceptions for the way each of us explains or tries to get a point accross, I doubt its very easy to say something and it be totally understood by everyone in the world, It would seem that most people in these newsgroups and indeed on the internet or either students or ex students and therfore (supposedly) educated, so they tend to pull up those with shall we say less of an education,

> > and show that there BASIC is better for making games, something you

 hehehe I shan't hold my breath, I have the greatest respect for all
programmers, and we already agreed that a lot of the best software
does seem to come from germany, at least by volume? not "all" the best
BTW, but I seriously doubt wether anyone from Germany or elsewhere are
making a stonkin good atari game in BASIC?, that's just an opinion.

> > documentation, manual, or a demo maybe?, where is it available and

>excluded. So your statement is wrong.

Exactly, GEM games are certainly not excluded, but you seem to be trying to make the point that in order for a game to be the best, it has to be GEM, and that I am afraid is laughable, I am not excluding GEM, but I have not seen a good GEM game made this year written in BASIC...have you ?, there are some of us who not only dislike GEM but would rather not have anything at all to do with it, personally I hate GEM, Personally I prefer software that does not use GEM,

> > Ho I agree totally, STOS can NOT access GEM, even though you state in

>
>I never said that! Not every OS call is a GEM call.

Well to be honest it confuses me, I do not know enough about GEM, I thought xbios calls where GEM related, I take back anything I said on the subject and will try not to talk about things I have no knowledge of :), seriously :)

> > hahahahahahaha yes I agree anything is better than STOS for making
> > GEM games.
>
>QED, your statement is proven to be wrong.

QED ?

> >....but who the F wants a GEM game ????
>
>People with big, fast Atari computers and big harddisks. I already told that.

Yeagh you did, and EVERYONE who has contributed to this thread has dissagreed with you....
Give someone with a nice big atari with a hard drive, the option between a GEM version of breakout or tetris or whatever else a GEM programmer can stretch to in the games department, then give him the choice of something spectacular thats none GEM, I won't tell you the answer, I will let you work that one out,hehehe

Your turn :)

Cheers.....!ynoT

Precisely. And in most cases, they take over the current video RAM, even if
they display nothing.

I am aware of the malloc for video RAM ...

>So what do you mean?

What I'm driving at is the ability to have data files treated exactly like
applications, but wihtout permitting them to access video RAM at all. IOW,
run as a background app using executable code loaded at startup - a TSR that
isn't permitted to access video RAM.

>The effect you want is obtainable by using the "Install Application" option
>in the GEM desktop (or the equivalent in an alternative desktop).

But not without video RAM access, so far as I have been able to determine.

>I get the feeling I must be missing the point of your idea, however. So

Uhmmmm. No. That's almost the opposite of what I have in mind.

>Is this what you are referring to? And even if not, is there any way around
>the problem?

If I knew a way around it, I'd be coding. <SIGH> I'm afraid my programming
skills are limited to what I have seen in examples - I learned everything by
typing in the programs in old Compuke, ST Log, Analog, etc., and modifying
the code to see what happened.

I know how to install apps (I said so in the first message). What I want is
a TSR that won't bugger the screen display when I play a non-viewable file
(e.g., an audio, MIDI, io MOD file).

>Currently I have clickies installed for MODs, WAVs, FLIs, MPGs, JPGs, GIFs

>The main advantage is they're not resident programs, therefore they don't
>tie up memory!

Memory is NOT the problem. Response speed is a requirement, so a TSR is
preferable; and a completely non-video operation mode is desired.

I guess what you want are TSR's that work in the background & never send
data to the screen. You could load these from the Auto folder.

What you need is some way of 'defining' these in the desktop.inf file, so
that when you double click on a MOD/MIDI/WAV file, the desktop 'sends' the
file to the TSR.

Currently, defining applications in the desktop causes these to be
started; you don't want the usual messages you get with program startup.

You need functionality like the desktop's show/print function (but without
the dialog box). People have written alternative file viewers that
intercept the desktops show/print, you would need to do this & call the
TSR.

Hello.
When I started programming GEM I had the same problem, the documentation I had implied that just putting NULL for the MFDB will point it to the screen, it does, it also implies that just using the name of an MFDB will copy to/from that MFDB. This caused crashes every time. What I found out (eventually) is that the fd_addr field needs to be set up in the MFDB as a pointer to memory. The easiest way I found to do this is via malloc() (not Malloc()) the C version is much better.

This made vro_cpyfm() to work. (I will dig up the exact code an post it at some point, email me for more info). This allows copying to and from the screen as well as between areas of the screen, and MFDB's.

As to what vro_trnfm() does, my understanding is that given two MFDB's (both of which must be of the same colour depth, i.e. nplanes must be the same for both) it will convert the source form from device specific into device independent and place it in the destination form, or convert from device independent to device specific. (Again email me for more info)

I hope this was of help, it took me months of playing around to get

this to work. I could not find any doc's on programming the VDI, except the PROGEM series, well worth downloading & printing, if you get it from funet.fi they have postscript & TeX versions too. Make sure you get the source code as well....)

Can anybody help me to write an MSX emulator?
I'm trying to translate one from the Amiga. It's written in 68020 assembly.
Also has anyone time to port the GameBoy emulator VGB from
http://www.freeflight.com/fms?
it's written in C. (Versions for *nix and MS-DOS)

Thank you very much....

OK you make a program, a game or something serious (apologies to all the "serious" game players I just insulted) and its taken you months, or weeks or years or whatever,

Then what?

I mean the next step surely is to let as many people as possible know your program is available?, especially freeware programs as there is no other incentive bar feedback and recognition, but we all want our releases to be seen as far and wide as possible, so whats the best way of going about it?

INTERNET: OK letting everyone know on the net then hoping for word of mouth to spread, not brilliant as supposedly only ten percent of ATARI owners are on the internet?

MAGAZINES: This is the biggest way, however theres only one left, looking at issue one released at the atari shows, they do have a good policy re: reviewing, hopefully this means we will see reviews of recently released software rather than stuff a few years old, so send it to the magazine,

PD LIBRARIES: Sorry to say this, but IMHO most can not advertise your software, they will have there loyal band of customers, but?
However there are two PDL's in the UK , Goodmans and Floppyshop who

send out updates of there catalouge to all there customers, so getting
them to add your title to there collection will ensure a mail shot
goes out to littraly thousands of ATARI users,

DISKMAGS: Send it to as many as you can, they will review it,there
are many active diskmags in the UK, some available overseas, between
them they will reach a heck of a lot of ATARI users,

WHAT ELSE?: Suggestions?.....

Cheers.....!ynoT

Hmmm... Well, "wuss" and "pansy" are synonyms. It's definitely insulting.
The intended meaning certainly had nothing to do with felines.];^)

> Anyway, nice to see you back mate, problems over with those sad meow
>idiots?...hope so?

Oh, hardly over, but the biggest offender has had his account terminated,
and I am quietly cancelling the rest of their trash in the newsgroups I
read. Can't be bothered with the rest of the net, of course. However, I
will give instructions in private email on how to cancel garbage messages
using Pine - in a way that is acceptable to everyone except spammers. Only
regular contributors to the *.atari.* groups will get replies.

Not that I would be able to implement this or anything, but when
I read Rich's proposal I thought it might be feasible through
.XDD or .XIF MiNT extensions, in which case you would be able to
bypass the desktop "install" altogether.

Comments?

Yves

Wout has seen a message about a 3d game in the german
maus.sys.atari.programmer (or something like that) groep. As he nor I was
intrested in game development at that time he didn't spend much ettention to it.
Only on my question for GEM games he came up with this answer.

Tony Greenwood wrote:

> OK hopefully you have mangaed to have a good looksy at the game i
> sent you..its all in basic and the actual source could be viewed in a
> text editor, ie no machine code etc,

Yes, I did. Hacked around, wonderd why you use xbios calls to set the screen adress and wait for the vsync, installed a own vysync rout to study your timing, patched the screen code to look at screen updates. Discovered that some vsync calls were better programmed then others

```
   lea 2(sp),sp       ; 4 bytes, 8 cycles
```

against

```
   addq.l #2,sp       ; 2 bytes, 8 cycles
```

and many more.

Lets start with the games. I got from you heartland and I downloaded from your homepage Hero and Multi Pakman.

Lets start with the worst, multi pakman:
It won't work from harddisk. It leaves with some errorcodes lockingup your mouse. The game itself works in 2 vbls (I guess) and uses byte copys to move the screen (ie it moves with 8 pixels at a time). The sprites are 16x16 sprites. The playscreen is 12 sprites long and 6 sprites deep.
As the character is placed in the middle of the screen there are only 2 sprites visible beneath the character and 3 above. That makes the game play bad because a deadly obstacle comming from beneath needs only:
2(sprites) * 16(pixels) * 40(ms screenupdate)/8(pixels per update)=
160 milliseconde to kill you. Everytim I pick up a bonus the game stops, waiting for you to press the joystick button, that's realy annoying. (See for a well done multiplayer pacman game The Synergy Mega demo, it has a great game called crapman. But that one doesn't count in our quest for good basic games.)

Less worse is Hero, updating the screen every second vsync and again scrolling on byte level. Again it doesn't work from harddisk. Gameplay would improve if one could intterupt looking in a locker by pressing the fire button. Not realy much to say about this game.

The best game is heartland. It has some realy nice graphics! It also has the greatest playscreen of the three games. Again the screen updates every second vbl. Scrolling is again on byte level. A strange thing is that the timing gets far worse by the sound effects (like pling when you grap a coin. There is a small bug in the edge detection. If you are on a platform you can stand with one foot on air without falling. On the left side you will fall down before you have reached the end of the platform. Switching to 60 Hz makes the screen updates every 3th vsync making the movements 'blocky', but that could be expected.

A pity that no time was left for free moving sprites, but not bad for basic, it by far the best STOS game I have ever seen. (Please notice, still needs the word basic to indicate the comparison level.)

> I got your demo done in BASIC, Yes definatly impressed, some of the
> screens can easilly be done in other BASICs now...

Don't think so, only the intro is realy simple to do. I think your assembly subroutine library is useless to do any of the other screens. (Remember all screens work on plain ST's, so no DMA sound, no blitter, no hardware scrolling....)

> Loved the main menu...very nice,

Let's add three one-bitplane ghots, some rater-dots to eat, remove the scroller and some scanlines form top and bottom to get some extra processortime to handle ghosts, ending up with a pacman game that's absolutely impossible to do in STOS unless you write a special library doing the whole thing in assembly?

> All this is made even more impressive by the fact that the sound is
> being replayed not by machine code routines but by your own routines
> written in the program, thats something I could not do....but then
> again dont need to :)

Maybe you should, my routines are faster as the original play routines!

> Yes impressed by your demo in BASIC...but it doesent alter my opinion
> that STOS is the best BASIC for making games at this moment in
> time?:)

You still did't talk about GEM games done in STOS, did you?

Don't think we are finished yet! :-)

So there is a memory stack on which you can allocate a memory bank. AT the moment you free a memory bank all banks below is will be moved to fill the space?

Doesn't seem very usable for me. The only way to access such a bank would be by start (or end) relative adressing. But then I have very slow access on large blocks (>64k).

Secondly they would by unusable for holding the current screen.

> The nice thing about banks is that you can use them for just about

You should tell this trick to Tony. He also has a lot of little files hanging arounf his program :-) . Maybe it's because most programmers are lazy people. It's too much work for them to put all the data in one large file or to include them directly in the program code. Both options can easily be done in both programming languages.

I wonder if it's fixed on a standard un-enhanced machine or not? I did
a similar thing once on my old 1 meg tos 1.2 jobby and got 120 odd
open before failure.

>Using too many workstations in one program will make this limit apparent
>more quickly, especially if the user is multitasking.

You have a point of course, even more so when most of the vdi source
code I've seen never even bothers to check for failure. The best
solution is to limit yourself to a very few workstations, used with a
little planning.

: preferable; and a completely non-video operation mode is desired.

I'm presently developing a 'Component Manager' that sounds similar to what you are looking for. Components are just the core part of an application, or simply libraries of functions. This if you want to make something like Media Player (MS Windows) then you have an app that looks for a certain class of

component.

I'm not going to go into the gory details any further.

This won't be finished for quite a while, however. It is being developed primarily for MiNTOS, but is being written so that it can be configured to work with excatly the same functionality under MiNT+single TOS/MultiTOS.

Cheers,

James Cox

Oooops, I think I mis-understood you...

Anyway, it could be done as a TSR but it's a lot of hard work hacking into the OS to get it to use a different viewer depending on the file you're viewing.

Also, the TSR would freeze the desktop if you were only running a single-TOS, and changes like those you state would be very prone to changes in OS and perhaps even the desktop installed.

Perhaps a better method would be to install the audio players as a Desk Acc, then you could set the desktop to call it whenever you double-click on a WAV or MIDI file or whatever. I guess this would require a desktop that at least supports the AV protocol to some extent.

i.e. I can get ST-Guide to view a hypertext by double clicking on it from
     MAGXDESK, but I don't think it works for the TOS Desktop.

This would be a TSR (of sorts), it would be more compatible with OS' and replacement Desktops, and is virtually instant. The problem for a lot of people would be that a Desk Accessory to view/play and large number of file types would be the large memory requirements... Not a prob with a 14Mb Falcon, say, but definately a problem on a 4Mb one.

Neil.

Let me guess: def is like #define in C. So you can say:
  def plus(a,b) (a+b)

or
  def arctan2(x,y) if(x<>0)then arctan(y/x)+pi*(x<0):else (pi/2)*sgn(y)
but this way you can not call a defined function within it self:
  def fact(x) if(x=0)then 1:else fact(x-1)*x
to give a very bad example of a recursive function, but real recursive functions are only needed in more complex situations.

No, you are wrong, if you enter youer code with toggle switches you have written the code in octal. Hex is something of the new generation. Try to hand compile 68k instructions in hex and octal. The latter is far easier. Same thing is true for a well known computer range with toggle switches: the pdp series from dec.

Wrong, people with such powerfull machines are still people playing games so now and then. Having overscan hardware is nothing special, nor expensive. I think we have found a important difference between UK and Holland and (even stronger) Germany. In the UK the ST is mostly
considered a game machine.

In germany the ST more used as a business computer, resulting in more high resolution applications and games (most high res games I know of come from Germany). A lot of modified hardware is in use or comming from germay (autoswitch overscan, high density modules, accelerators (like PAK030), medusa, hades (Switserland to be precise)).

And also on the software level you can see the difference:
Warp 9 in GB and the US against NVDI in Germany, Geneva against Magic when it comes to alternative multitasking environments (except for mint being a german product, made into the basis multi-TOS and now used on both sides), STOS and hisoft basic are typical for the english speaking Atari community, in Germany it's Gfa basic, or less common, Omikron basic. Reason for this difference? Germans don't wan't to use software in the english language with english manuals

and most english speaking people can't read German at all, so German software is out of the question!

Where the french people come in this picture I don't know, but they are also pretty stubbourn and pround on their language, so I think there is an entire subculture of french Atari software.

An other example: in this english newgroup I got over the last four days about 60 messages, the other english Atari newgroups are not much better. In the Maus.sys.atari.software newgroup I got in the same time about 860 (yes more than eight hundred) messages.

Here in the Netherland we are somewhere between the enlish and german culture. Most of my utilities come from germany, so is my Basic, C -compiler and Assembler (although I also have de Lattice C compiler). I have got a German profibuch and a german Atari magazin.

So here ends some explanation about the different atari cultures.

> : And what about the new Atari clones? Go back to start and try
> again?
> Again very few and STOS programs work on 206 which is the
> current standard TOS in emulators eg Gemulator 96

Again the difference, the emulator is called Magic (Mac/PC) and is an complete OS (second german emulator is TOS2WIN).

The Atari Programmer's User Group

It's that time of the month again...

ICTARI 40 is now available on my web-page. Go to:

http://www.elis.demon.co.uk/ictari/ictari.htm

I've had a few new readers fill out the form on the web-page, from a variety of corners of the globe. No-one has mailed an article yet, though. Come on ! Filling out the form can pay off. One bloke added a comment that he didn't know of any Atari FORTRAN compilers. This is about the only area of Atari programming where I can call myself an expert, so I wrote a short article. Next month's issue might even come with a freeware FORTRAN compiler.

Due to other commitments, Peter Hibbs is stepping down as editor ! ICTARI 41 will be his last issue. It need not be the last *ever* issue. Suffice it to say, the job is up for grabs. If no more suitable candidates present themselves, I may consider having a go. Read my FORTRAN article, and see what you may be letting yourself in for ! All details are in the magazine.

Have Fun,
"Augeas"

```

Yes, your teacher is right. Head only and tail only recursive function can be converted into while loops. But recursive functions making multiple calls to it self in the middle of the code, or just one in a loop like most directory scanners can not be converted into a while loop without the use of a sort of stack emulation.

> Correct - except for 3d games. (BSP trees, for example)

Never did 3d vector work, only a single 3d sphere spinning around 3 axis, sorting is not needed in that case. So I don't know about BSP trees. They might be needed to figure out which object has to be drawn first.

All you need is a just normal program that simply doesn't output to the screen.
That is easily done. No TSR is necessary.

>Currently, defining applications in the desktop causes these to be
>started; you don't want the usual messages you get with program startup.

You don't have to get the "usual messages". It's entirely just what messages
the programmer puts into the program. Just the same way as a TSR could have
various messages.

Using a TSR will not solve the problem.

Using a program that does not output to the screen, be it TSR or not, will solve the problem.

>You need functionality like the desktop's show/print function (but without

I presume you have a hard disc drive, in which case software generally loads quite quickly anyway.

Alternatively, you could just set all your file viewing software to load at startup so that the desktop passes files to them by the AV protocol. This way you don't have to wait for the software to load, since it is loaded all the time.

 Actually my comment was a "real" question as apposed to a statement,

I honestly have never used the STOS "def" command, but from the brief glance many years ago, it struck me thats what it was for, but I honestly dont know? :)

I would wonder why someone who has "upgraded" to a machine capable of
so much, would want to play a game that can at most only manage 16
colours and in comparison to there machine would be classed as slooow,
for example, the games I make would look very silly on my pc, if you
see what I mean :)

>think we have found a important difference between UK and Holland and (even
>stronger) Germany. In the UK the ST is mostly considered a game machine.

heheheh ho dear, glad I didnt say that...duck! :)

>In germany the ST more used as a business computer, resulting in more high
>resolution applications and games (most high res games I know of come from

Yes any high res stuff I see, games or serious or whatever are all
from Germany...

>And also on the software level you can see the difference:
>Warp 9 in GB and the US against NVDI in Germany, Geneva against Magic when it
>comes to alternative multitasking environments (except for mint being a german
>product, made into the basis multi-TOS and now used on both sides),

Are you saying that MOST of the best ATARI software comes from
Germany?, if thats what you are saying, then I must totally AGREE :)

>STOS and hisoft basic are typical for the english speaking Atari community, in
Germany

Dunno about Highsoft, I am having real trouble finding more than a couple of users, but STOS (although I am biased) is used widely, its very common and every single PDL is packed with STOS written programs,

>it's Gfa basic, or less common, Omikron basic. Reason for this difference?

Is Omikron still a live product, I presumed it was an old BASIC?

>Germans don't wan't to use software in the english language with english manuals

I cannot blame them :)

>and most english speaking people can't read German at all, so German software is
>out of the question!

Absoloutly correct....

>Where the french people come in this picture I don't know, but they are also

Francois Lionot and his equaly hard to pronounce mate, Authors of STOS BASIC...

English speaking group you mean, its hardly an English group is it, too much riff raff for that, why theres even Scottish people in there,

<THAT WAS A JOKE EVERYONE> :)

>Maus.sys.atari.software newgroup I got in the same time about 860 (yes more than
>eight hundred) messages.

And I take it all the messages are in German?....personally I would love to see a hell of a lot more messages in the comp.sys newsgroups, instead of 90% of people moaning about CAB not working (wonder how many of them registered it?) and the rest are people falling for flame bait:)

>Assembler (although I also have de Lattice C compiler). I have got a German

 eh? I do not understand your last comment? Gemulator can use TOS 206
and in fact is reccomended, and STOS does work under Gemulator on a PC

<SMILE>

 hmmm I may have lost this bit...but STOS keeps track of the banks,
you can erase delete restore reseve banks to your hearts content
throuout your program all you need to do is tell stos which bank your
data is in and it finds it,
 You can say the current screen is in bank 7 (for example) and no
matter how many banks you erase or make, 1-6 or 8 to 15, stos will
allways know where bank 7 is, that IMHO is the clever bit,

 so unpack 7 to physic , and stos would allways know where the data

was to unpack, no matter what

  you can do a little extra yourself, variable=start(7) or end or
length etc is used a lot :)

> > that you can use them for including binary data in your programs

> > written in C. :)
>
>You should tell this trick to Tony. He also has a lot of little files hanging
>arounf his program :-) . Maybe it's because most programmers are lazy people.

 hahahaha, a couple of things.....First: whats wrong with having lots
of files on disk? why would I need them all in one file, whats the
advantage of that? all are loaded into banks when the program boots
up,

>It's too much work for them to put all the data in one large file or to include
>them directly in the program code. Both options can easily be done in both
>programming languages.

 You Kiddin?, about 3 mebbe 4 lines of code containing around a dozen
or so commands total and you have all your data in the one bank, but
why?

 whats wrong with the way it is?

                    Cheers.............!ynoT

WHAT?....I used BASIC, how it is compiled is nothing to do with me..sorta, I know that sounds a bit like "I'm only the Driver" but I have no idea what the hell you are on about, I can't use xbios calls from within STOS BASIC, I cannot do any of the commands you just quoted?

What I can do is type the BASIC command in, if that in turn does the above? then that's up to the people who programmed my BASIC language, I have no idea what lea,addq or whatever else you wish to quote mean?, I code in BASIC

<GULP> The worst...thats my favorite, but you knew that ?

>It won't work from harddisk. It leaves with some errorcodes lockingup your

Getting something to work from hardisk, that was the same problem as getting something to work on a falcon, I do not own a hard drive, I don't even own a drive B?, at the time of making multipakman and HERO I did not even know anyone who owned a HD and my manual has no documentation re: hard drives, therefore at the time of making those games that don't work on a hd, I simply did not know how?

>mouse. The game itself works in 2 vbls (I guess) and uses byte copys to move the

Yes it does lock up the mouse on exit sometimes, I put that in the documentation, so if it was going to cause a problem then it was forewarned?, yes 2 vbls..so?

>screen (ie it moves with 8 pixels at a time). The sprites are 16x16 sprites. The
>playscreen is 12 sprites long and 6 sprites deep.

Correct ?

>As the character is placed in the middle of the screen there are only 2 sprites
>visible beneath the character and 3 above. That makes the game play bad because
>a deadly obstacle comming from beneath needs only:

ARRRGH BAD! what are you talking about!.. it makes the gameplay more difficult and more challenging, maybe I should have made the area bigger and the game slower for the underchallenged:)....the games not supposed to be easy, YOU are supposed to overcome such obstacles, the gameplayer should be able to figure out when the deathblocks will appear, its part of the gameplay, play play play, practice and overcome, surely that's the whole idea of a game ???????

>2(sprites) * 16(pixels) * 40(ms screenupdate)/8(pixels per update)=
>160 milliseconde to kill you. Everytim I pick up a bonus the game stops,
>waiting for you to press the joystick button, that's realy annoying. (See for a

So it would seem, I hold my hand up to this one,this has been mentioned before in reviews, and had I made another version then it would have been changed, its not bad programming IMHO but a bad choice of gameplay?...Yes?

>Less worse is Hero, updating the screen every second vsync and again scrolling
>on byte level. Again it doesn't work from harddisk. Gameplay would improve if
>one could intterupt looking in a locker by pressing the fire button. Not realy
>much to say about this game.

that's because you didn't play it enough...had you gone past the first three trainer type levels, you would have then got to the real meat, the extra baddies, the need to find and use explosives on doors, the need to find ammo for your gun and use it, the need to work out lots of things in order to finish the game, you would have also encountered lifts and teleporting doors, and a hell of a lot more, more graphics etc etc, end of level animations,
play the game fully before you announce to the world its not very good please ? :), what about the 20 odd different ways for the guy to die, the 300+ animations for the main sprite, the free moving baddies that don't rely on a simple left/right preset routine, what about a lot of other things?

>small bug in the edge detection. If you are on a platform you can stand with one
>foot on air without falling. On the left side you will fall down before you have

that's utter crap!, you make the game sound rediculous, it is nothing like you say, you cannot stand partly in mid air giving a false impression, that's utter and utter crap!

I am not even going to bother with the rest of this, you have done a hatchet job on the games, for example, you make a point of mentioning there are no free moving sprites in heartland, yet suprise suprise you

don't mention there are loads of them in HERO...patheticly one sided
just like the rest of your comments,

The thread is...STOS is the best BASIC programming language for
making games in 1996, and I added C to the equation just to make the
point,

You can pathetically rip my games apart all you like, you can prattle
on about demos all you like, but you cannot show me a game written in
BASIC other than STOS that's better than a STOS written game and
therefore would be the proffered BASIC for someone to use right now,

I showed you...all you have shown is a demo ?

People who view the above games from a gameplayers point of view,
like them, they neither know or care how many vbls something takes,
they play the game, and they like it or don't, the majority like the
above games, the magazines that review them absolutely love the games,
not only top marks but awards as well, (bar Heartland that's awaiting
its first review) <yikes>

In all the postings, you have yet to show me anything that even comes
close to suggesting that today, there is anything better in BASIC for
making games, you have talked a good game, but shown me no games ? and
that's the thread, I showed you some STOS ones that you made a sad
attempt to belittle, now you show me a top 1996 game made in BASIC

YOU CAN NOT HAHAHAHAHAHA

<STILL SMILEING>

Cheers.....!ynoT

Heartland had DMA sound on STE? (looped sample - 6kHz, so doesn't play on the Falcon).

Blitter and hardware scrolling would make it incompatible with normal ST's, which isn't what Tony wanted...

>Let's add three one-bitplane ghots, some rater-dots to eat, remove the scroller

No, but seriously, these are not a real issue due to the low numbers. Yes, there are a couple (nethack, breakout, landmines, patience etc.) but these really are not the sort of game we are talking about, are they?

>Don't think we are finished yet! :-)

hehehe... :-)

newsgroups: comp.sys.atari.programmer

Does anybody out there would like to take over an Atari support for gawk (be it under TOS or other OS, although Linux does not need much support I guess :-). The next incominig release (soon) still compiles, with glibc, and works on Atari/TOS. After that this will be still likely the case, but you will be on your own if somebody will not take over. :-) I will not have an access to a hardware anymore.

The code nowadays is basically clean (it compiles correctly on 16, 32, 64, and possibly other widths, bit wide architectures). Maitenance consists mostly of keeping an eye so the code will stay that way :-) and watching Atari Makefiles, config and README's so they will not drift too far away from the main body.

If there are any volunteers please contact Arnold Robins (arnold@skeeve.atl.ga.us) and me (michal@ellpspace.math.ualberta.ca).

Thanks,
Michal

reply-to: J.B.W.Webber@ukc.ac.uk (jbww)
newsgroups: comp.sys.atari.programmer

I think I have some answers myself, about my questions regarding the raster operations on the ST.

I have looked in the original Digital Research docs, in the Prospero C and Pascal VDI binding books, and in the ProGem docs, as well as experimenting a bit. I am using gcc, gem lib patchlevel 31, and TOS 2.06.

vro_cpyfm :

What the books say is that if the size of the xypixel map is not the same for source and destination, then the size of the source is used.

What I see is that size and shape must be the same.

i.e. pxyarray[6] pxyarray[7] are only used to find the smallest xy coordinate as the starting point; size and shape come from the source coordinates. Please correct me if you think I am wrong.
I can see nothing in the gem lib that could cause this behaviour.

Thus it is not possible to copy from a vector of bits to a rectangle on the screen. What you must have is a map of bits, layed out in the same shape as the screen bits, padded out so that each scan line starts on a 16bit word boundary.
i.e for a pattern that is to be 52 bits wide must be padded out to 64 bits, before starting with the next scan line.

See below for some code that generates a simple pattern, pads it out to be in a form suitable for vro_cpyfm to copy to the screen.
To follow a vro_cpyfm copy from screen there is then some code to convert back to a packed bit pattern. This example code calls no gem functions, so it does not need to be linked to any libraries, just displays the patterns in hex.

Thus to copy from memory to the screen, pxyarray should contain something like :

```
0,0
width-1,height-1
Xposn,Yposn
Xposn+(width-1),Yposn+(height-1)
```

the last line could be Xposn+(height-1), Yposn+(width-1) and it would make no difference.

In addition , the width in words (widthw) must be written to the MFDB[5], and widthw*16 to MFDB[3], height to MFDB[4], and the long address pointing to the data to MFBD[0],[1].

For a screen MFDB all that is needed is to write 0,0 to MFDB[0],[1], and the ST fills in the rest.

vr_trnfm

I gather that Atari standard B+W screen is the same as the GEM 'standard form'. Perhaps that is why so-far I have seen no change to any Memory Form Data Block (or the data it is pointing to) after a call to vr_trnfm. At the very least I expect the mode bit to toggle. If the src and dest are set to be the same, it should read a MFDB, modify it, and write it back. Puzzled.
Any way, there seems to be no need to use it as long as I stick to high res screens.

I can now copy between packed bitmaps and the screen OK.

Hope someone else finds this useful.

cheers
     beau webber

: C....

Hmmm! Been on those soft drugs then? On what measure do you think that STOS is better than any of the above? You use different programming languages to give different results. For instance STOS is perfect for games which make small demands on the CPU, or to cobble things together quickly. GFA is perfect for making easy to read, and maintain programs. Hisoft (not Highsoft) is better for more traditional basic programming. C is for hacky programs that work very fast.

: Anyone want to prove otherwise ?
Set your benchmark. What about a Scrolling background, with a number of

sprites? More important than the programming language is the programmer.
For instance I have used all tha languages you mention except Hisoft. I
use assembly to put the speed, or tricky bits in. Not usually because I
cannot do the task in GFA for instance but for two more constructive reasons.
1. When 'inline'd it works at the same speed in the interpreter as in the
compiled version.
2. It is often easier to program graphics routines in assembly than to
try and get the programming language up to speed on that task.

: I will put STOS games on a head to head with any others, and win...
That is why most commercial games were written in STOS is it? I have made
programs that people could not tell the language (the hallmark of good
programming), I defy a STOS programmer to hide all traces that it is a
STOS program.

: Who wants to see a game with a green backdrop and scroll
: bars?...hahaha GEM Phoooey
Tis not necessary to have these. When you learn how to use the other
languages better, you wont have to have these bars.

: C'mon you programmers, lets see you make a decent game NOW
I also did not thank that programming languages provided gameplay.

: *****************
: This has been a "lets liven up
: the newsgroup posting", Did it
: work ?
: *****************
More considered comment on the deficiencies of the above programming
languages may have been more appropriate.

Tony, you're kidding, right? Maybe you call it something different in
the UK. A toggle switch is a simple on-off flip switch. What is be
referred to is the old monsters that had 8 switches in a row. By
turning various switches on or off you directly programmed in binary. I
don't know exactly how the program was saved, but these things were very
large. About the size of a medium copier. I saw one of these a few
years ago and almost bought for the sake of nostalgia. But my garage
was already full. See ya.....j

Go to the library and find an old Byte magazine or possibly Popular Electronics - look for an IMSAI or SWTPC DIY computer project and you'll find the front panel has an array of switches. Those are actually used to enter the program code in binary; set the 8 or 16 switches, hit the "enter" switch and step to the next memory address; repeat until the program is entered. Then set the start address in binary on the switches, hit "go" and watch it run.

No, we were talking about my demo. Tony was saying some of the effects could easily done with a modern basic. I still am very curious which effects cab easy be done with a modern basic without useing above mentioned features.

 > Well, there are single bitplane sprite routines, but not having seen
 > the demo you are referring to, I cannot comment any further....

The single bitplae routines are not the problem. It's generating the playfield. That cannot be done with STOS basic (nor with Gfa basic) without writing a special routine which does the trick.

 >> You still did't talk about GEM games done in STOS, did you?
 >
 > No, but seriously, these are not a real issue due to the low numbers.

Maybe for the english speaking Atari community. As I pointed out the German speaking part has different standards

 > but these really are not the sort of game we are talking about, are
 > they?

At the beginning of the thread Tony made it very clear game programming is game programming. It was a clear statement he said. When we are starting to rule out certain games the statement has to be changed. Maybe
something like:
STOS basic is the best basic for writing arcade games if you are english speaking and only want to write games for the ST and STe.

No, no, I want to have the physic screen in one of the banks. This started with someone claiming STOS mamory banks where great thing, no need to malloc memory and so on. One of the things memory is used for is to hold the screen data. But from the stories I heard about those memory banks I undestand they are moved by the languages memory manager around in memory. This means you can't keep the adresses of much needed data in a variable, but you always have to tell wich bank you need on on which adress in the bank the data is.

>
> whats wrong with the way it is?

Well, you had the lame excuse that some of your software wouldn't work because you hadn't one? Put all the data in the program file, or in one big data file that has to be in the current directory and you don't have to bother where your files are located (on disk, harddisk, networkdrive or maybe even on tape). As long as you can open a file in the current directory (something like open(#1,"game.dat)) and you don't have to bother where your data is allocated or how exactly to handle the device. Your OS will solve problems like that for you.

Other reasons: smaller risk of loosing data, faster copying, less slack space on the medium, better compressable.

So why not?

You can't use XBIOS calls in STOS basic? And the rest of the OS, it's forbidden playgroud too?

> Getting something to work from hardisk, that was the same problem as
> getting something to work on a falcon, I do not own a hard drive, I

Lame excuse. Loading from disk is exactly the same as loading from harddisk (from the OS's viewpoint). Just don't insist of getting data from drive a and don't use a absolute path. An other solution was discussed somewhere else.

> So it would seem, I hold my hand up to this one,this has been

A bad choise of gameplay enforced by the limitations of the used language?

>> small bug in the edge detection. If you are on a platform you can

>> before you
> have
>
> that's utter crap!, you make the game sound rediculous, it is nothing
> like you say, you cannot stand partly in mid air giving a false
> impression, that's utter and utter crap!

It's true: Let me draw it in ASCII

```
   __          __
  (..)        (..)
 /(  )\      /(  )\ <-- The playing sprite
   AA          AA   <-- Right foot is not
    ##############        standing on the platform
   ^  platform          and the sprite doesn't fall down
    \
     - the left food isn't standing on the platform, the
       sprite does fall down.
```

I am calling the fact that the sprite does fall down in the left situation a bug in the program. It shouldn't be that way.

> The thread is...STOS is the best BASIC programming language for
> making games in 1996, and I added C to the equation just to make the
> point,

Still you didn't mention anything about writing GEM games in STOS. So I say: STOS basic is totally useless for writing GEM games and so it is NOT the best basic for making games in 1996. So either Gfa, Hisoft or Omikron basic is the best basic for making games, because those basics allow you to write GEM games.

It's a reasonable thought. I may have an extension of that idea in mind - see below.

>i.e. I can get ST-Guide to view a hypertext by double clicking on it from
>   MAGXDESK, but I don't think it works for the TOS Desktop.

Actually, I think that does work in TOS 1.2 - that's the earliest TOS I have ATM.

>This would be a TSR (of sorts), it would be more compatible with OS' and
>replacement Desktops, and is virtually instant. The problem for a lot of
>people would be that a Desk Accessory to view/play and large number of file
>types would be the large memory requirements... Not a prob with a 14Mb
>Falcon, say, but definately a problem on a 4Mb one.

What about a "shell" DA that identifies the file type by the extension (making proper filenames a necessity!), then looks in a little config file or just in the EXT folder, perhaps, and loads/runs the proper player? Something like CPXes - actually, CPXes might be able to do the job; I don't know how to communicate with 'em, but that's not my problem directly anyhow, not yet, at least.

Biggest problem I can see though is the malloc problem - it would be best if the player EXT could malloc as much as it needs and then free it when done, but I don't know if that works in a DA, either.

I am not talking of PC's, I am talking about Atari power users. People with processor accelerators, TT's (or better), enhanced hardware. On TOS parties only 16MHz or fatser machines are allowed to connect to the MIDIMAZE network. This to speed up the game. We used to get enough machines for a good game.

There aren't much games specially written for TT's and better so it's either palying GEM games and (patched) ST games or playing no games. Gem games are nice because you can play them while the C compiler is working it's way through your multi-megabyte C source.

> > Dunno about Highsoft, I am having real trouble finding more than a
> > couple of users, but STOS (although I am biased) is used widely, its
> > very common and every single PDL is packed with STOS written programs,

Again, wrong, you are seeing the english speaking Atari world. Asuming a PDL is some sort of public domain disk lets have a look a the ST Computer public domain pages (ST computer is a German Magazine):

- Don't wory, be happy!, Gem version of ludo
- Nanjing, Gem game (Acc or program)
- Sokoban, Gem version of sokoban.
- Invers, Gem game..

and so on..

The april 1995 edition has ten new disks, 4 of them containing Gem games, I am realy wondering how much of those games where written in STOS (none I think), Gfa Basic, C and assembly, can't see though, it isn't mentioned.

> > Is Omikron still a live product, I presumed it was an old BASIC?

Hmm, there is someone telling STOS is the best basic for game programming, doesn't know what other basics are doing! Well let me inform you: The newst

Omikron basic is vs 5.02 from 19-05-1996. It's now running on the MagiC OS too (Mgic, MagiC Mac, MagiC PC). So you can program your games on those OS's and they will work on those OS's (unless you choose to use computer specific features, like DMA sound, our direct acces to special hardware registers..).

What about STOS updates? Which is the old basic?

> And I take it all the messages are in German?....personally I would

Ofcourse, it's a German newsgroup. Stunning, a bunch of german Atari users are cabable of producing more messages than the english speaking 'the rest of the world'.

>>Again the difference, the emulator is called Magic (Mac/PC) and is
>>an complete OS (second german emulator is TOS2WIN).
> eh? I do not understand your last comment? Gemulator can use TOS 206
> and in fact is reccomended, and STOS does work under Gemulator on a
> PC

Gemulator is not THE ST emulator. You have Magic Mac for emulating an Atari on a (power) Mac and Magic PC for emulting an Atari on the PC. Those emulators are comming with the MagiC OS (in fact the emulator can boot from any ST rom image, but that is not documented).

>Hmmm! Been on those soft drugs then? On what measure do you think that

 No, cheap wine, probably has the same effect, is cheaper and legal
:))

>STOS is better than any of the above? You use different programming

 "what measure"? thats easy, from what I can see ? simple as that! I
can see good STOS written games, cant see sod all from anyone else in
BASIC ?

>languages to give different results. For instance STOS is perfect for
>games which make small demands on the CPU, or to cobble things together

 ho dear?...sorry but you really must check out something thats made
in STOS thats been upgraded, ie 1996 STOS, the rest of your posting is

I am sure based on old STOS :(....I would be gald to send you
something that will blow your socks off,

STOS HAS BEEN UPGRADED or havent you been following the thread?

>quickly. GFA is perfect for making easy to read, and maintain programs.
>Hisoft (not Highsoft) is better for more traditional basic programming. C
>is for hacky programs that work very fast.

Yes I would probably agree, indeed if you look at other postings you
will see I am trying to find out as much as I can about highsoft
basic, I never said STOS was the best BASIC, the point I am making is
that, if someone wants to make a good game NOW, in BASIC or C, then I
would say that STOS is the best IMHO :), (any many others<G>)

>: Anyone want to prove otherwise ?
>Set your benchmark. What about a Scrolling background, with a number of

Ho hello, someone with the balls to put there program where there
mouth is hey, well go for it!, tell me what you can do in BASIC for a
game, and I will show you better in STOS...do it! or come back and
tell us all why not ?

>sprites? More important than the programming language is the programmer.

hahahaha done it, go to my page and check some of my software, how
about a jigsaw type puzzle made out of a smooth playing video,*.VID
file, split the video up into 30 smaller parts with each part playing
at excatly the same speed and independantly, now give the user the
control over any part, to pick up and drop, but keep the video he
picks up, ie the 30th peice playing,

I have released at least 4 games with very large play areas
consisting of 8 way scrolling and sprites, independant of each other
have a look.....

>For instance I have used all tha languages you mention except Hisoft. I
>use assembly to put the speed, or tricky bits in. Not usually because I

The thread is "best BASIC for gamemaking" not assembly ? tut tut

>cannot do the task in GFA for instance but for two more constructive reasons.
>1. When 'inline'd it works at the same speed in the interpreter as in the
>compiled version.

eeerm SO WHAT ? I can run a STOS program from within STOS at exactly
the same speed as compiled?

>2. It is often easier to program graphics routines in assembly than to
>try and get the programming language up to speed on that task.

Again the thread is "best BASIC" not best language, only an idiot

would say STOS or any other BASIC is better than assmebler, please
stop moving the goalposts ?

>: I will put STOS games on a head to head with any others, and win...

>That is why most commercial games were written in STOS is it? I have made

 No, the reason STOS never made the commercial market was because when
the ATARI commercial market was in a good position, STOS was crap,
the whole point if you have been following this thread, is that STOS
is the best BASIC for game making today...but yet again you try to
move the goalposts ?

>programs that people could not tell the language (the hallmark of good
>programming), I defy a STOS programmer to hide all traces that it is a
>STOS program.

 ok try H.E.R.O. it fooled the hell out of the magazines when it was
released, enough that when i told them it was STOS they even wrote an
article saying how suprised they where, GET REAL, get in to 1996, you
are still talking about STOS of old, suppose you are still seeing the
STOS fade and the crappy mouse pointer and MBK files, Sheeeesh :(
 Since HERO I have stopped trying to hide the fact that its STOS, what
difference do you think it makes to the person playing the game,
 So a sign of a good programmer is the ability to hide its language,
WHY? thats a daft thing to say ?

>: Who wants to see a game with a green backdrop and scroll
>: bars?...hahaha GEM Phoooey
>Tis not necessary to have these. When you learn how to use the other

 waddaya mean why?.....hahahaha.....why not?....ynoT..GEDDIT!

>Atari Enthusiast, with a burned computer. Alas. GFA is the bast anyway!

 NOT FOR GAME MAKING ITS NOT, or would you like to prove otherwise, or
are you all talk as well ??????
 I can show you a game made recently in STOS that is not fantastic,
but is reasonably good, You show me something

 All these people quick to debate the point that STOS is the best
BASIC for making games, yet not one of you can show me ZZZZzzzzzz

 ALL TALK THE LOT OF YA! HAHAHAHAHAHAH :)

 <Serious Smile>

                    Cheers.....!ynoT

>
>Hm... yea, this could well be true...

 From your point of view maybe Anthony, but if you look at it from the view of a STOS BASIC programmer who cannot write his own extensions, he uses the ones you and others have released, he then treats these extensions as upgrades to his language disk, this is after all what the whole concept of extensions was built in for?
 So your average BASIC programmer uses the extensions as upgrades to STOS, thus he is still using STOS BASIC, albeit an updated version, therefore anything he produces can (without stretching the imagination) be classed as written in STOS

>>Most mordern languages allow you to call external routines in a
>>more or less easy way.

>Yes. STOS does this.

 Yes it does, as most other lnguages allow this, as pointed out, then they are on a par?

>>So it ends in a game where al the main game routines are assebly and only some
>>disk routines and initialisation is done in the original language you started

 poppycock!

>>with. (I have done that once, converting every routine that used more than 1% of
>>the total execution time to assembly.)

 How can this be true, I use extensions and any add ons I can find, yet I only know BASIC, hmmm how can I put this?, no matter what I do in my program, however way you look at it, it will all be done in STOS using STOS BASIC commands, therefore the end result will be a STOS written game?

>As long as your library routines are efficient enough, then there should be
>no need to convert most of the routines to assembler. Only if there is no
>library routine which does what I need have I turned to assembler... (which
>I put into a library routine, so that other people can use it if they need it...)

 again...to you it is an assembler routine, but if packaged in the form of an extension, and given commands to utilise it, then its a BASIC upgrade :)

>As I said - the lack of proper functions IS a limitation of STOS.

 Sorry Anthony, could you explain that last sentance, whats a proper function? and why does it limit STOS, although I am unsure of what you speak, I have to say that after over 50 releases, I have never felt limited in any way ?

No, that's the point of opening virtual workstations with v_opnvwk().
Even though it does use the same screen for all output, all attributes,
such as line style and colour, marker height and color aso are specific
for the virtual workstation you open.

You may also open more than one virtual workstation, if you like. This can be very useful if you regularly use two (or more) different attributes, so that you don't have to change them all the time.

Greetings,

Tomas

You may want to review your compiler settings. There some options pertaining to external calls. You may also check to see if you need to be in supervisor mode for the area of memory you are poking data into. (ie. protected system memory).

Had a thought (I know, mark the calendar! <G>) and, while I am not competent to implement it, surely there's someone here who is.

One feature that TOS lacks is the ability to add extensions easily; that is, while I can install any file type to call an application, that app will open a workstation (in most cases) and display something on the screen while running.

I'd like to see the ability to simply double-click on, say, a WAV file and have it play through an "extended OS" which doesn't use any screen memory at all. Such an extension ot the OS would, I imagine, have to load in the AUTO folder before GEM starts, and would add the supported filetypes to the internal list of executables; however, when one of the "new" executables was launched, the OS extenstion (let's shorten that to "OSX") would intercept the call and, instead of attempting to /run/ the file, would handle it as data for internal routines that would read the file, determine if it was the proper type (in my example, a RIFF WAV, AU, RA, or other audio file with built-in playback parameter data) and then execute code to do something with the data file (our example audio player would route it to the Yamaha chip, the DSP, or the STe DMA sound microwire). If the data type was unsupported, the usual OSX would let it "fall through" to the usual OS routines for TOS and GME applications.

Comments, suggestions, or explanations of why I am too stupid to live (with charts and diagrams) welcome.

No, I am telling you that while programming and optimizing your game you will get to a point that your standard (or library) routines can not improve your speed anymore and you will have to write your own, very specific routines to improve the game more.

 > hmmm "might" ?, I say might NOT, I am willing to show that STOS BASIC
 > is the best for making games in 1996 between any other BASIC and even
 > C, That was the original question

Yep, and I am trying to tell you your statement is too general. I am quite sure C or Gfa basic are far better to produce a game working under GEM running on every Atari under every resolution and TOS version.
Example? Nethack (it was written in C\C++) works in ST LOW, ST LOW overscan (400x240), ST HIGH, ST HIGH overscan (720x480) and on the different TT resolutions. I even expect that game to run on a Hades 060 or Magic Mac. What about text adventures? That are games too! If I had to do a text adventure my primairy choice would be C! You told me that making games is making games so these types of games are not to be excluded.

 >> Civilization is done in C and Colonial conquest too. I don't know the
 >> amount of assembly that's used in those projects. It's quite easy to
 >> design your code in
 > C
 >

> Neither do I, so surely that excludes them from the debate ?...next:)

No, lets say they used a graphics library someone wrote. I think the amount of assembly code in Colonial Conquest is quit low because it runs on a TT and gets a great performance improvement from a screen
accelerator.

> Yes they do don't they...and IMHO are STILL as usefull as a glass
> brick?

Just as games are?

> Then how do you know its great and how do you come to the conclusion
> that it is better than a STOS game ?

Well, I was not telling you it will be better than a STOS game, I was telling you they were making a great game in Gfa. I know it will be a great game because someone with a good taste for games was telling me so.

> Here we go again, WHY does everyone have to base there opinions and
> debates on STOS of old, STOS HAS BEEN UPGRADED! how many times does

Yes, reading this newgroup I understand all works fine on a falcon as long as you write your own keyboard routines. No problem for you, you will call it a upgrade (I would call it a cludge) and for a new piece of hardware you will have to wait untill someone cares to 'upgrade' your basic so you can use the new features, C however will produce working code for the new hardware.

> this have to be said, TOS compatability is no longer a real problem,

> that when I VARPTR or maybe when I use BINARIES that these are not
> BASIC commands? memory moves and anything else you wanna mention are
> all valid BASIC programming,

No, I am saying that writing a program that manly exists of peeks, pokes and memory moves is almost the same as writing the code in assembly. Only in assemply you call peek and poke move.

> BTW Hans..do you have an STe? or FM? Can I send you one of my games
> in return for the Demo you wrote ? <SMILE>

I have got an 1040STf with 4Mb of memory. Please send me one of your games. But send it to: mr_ni@mst.tn.utwente.nl . It's my e-mail adres at the university and

it's a lot cheaper for me to get large amounts of data on that adres. I will send you my demo.

Please tell me about it. I have heard STOS memory management is one of the worst available. Scavy programed chipmon II in STOS. It worked fine on a 4MB STe. However on 1MB ST you had to wait ages for STOS to complete its garbage collections.

> spacially and computationally efficient form)

No, you can nor convert any recursion into a while loop, at least not without a sort of stack emulation. Comming to that point I am sure it's faster to and more memory efficient to use the build in stack mechanism of the 68000.

However most standard examples of recursion in programming courses are examples of 'false' recursion. A recursive algoritm to calculate x! is a well know example of false recursion. Those false recursions ca be rewritten as a while loop.

But tree traversel routines realy do need recursion. Like routine that outputs the data stored in a binary tree in order:

```
struct node_s           /* definition of nodestruct */
{
  node_s *c_left;       /* pointer to left child_node */
  node_s *c_right;      /* pointer to right child_node */
  key_type key;         /* Key of the node */
};

traverse_tree(node_s *node)
{
  if(node->c_left!=NULL)         /* is there a left child? */
    traverse_tree(node->c_left); /* yep, first print values
                                    in the left part of the tree */
  output(node->key);             /* print value of node */
  if(node->c_right!=NO_NODE)     /* is there a right child? */
    traverse_tree(node->c_right);/* print values of right part of tree */
}
```

Most games don't need those more complex data structures and routines to handele them.

Bye, Hans

I haven't seen you original question but it looks like you are working on a sort block-copy using movem.

On the 68000 movem is the fastest way to move (huge blocks) memory around. The fastest way to copy a block is somethin like this:

```
   movem.l   d0-d7/a0-a7,register_storage ; save registers
   lea       source_adress+length-56,a0   ; end of source block - 56 bytes
   lea       dest_adress+length-,a1       ; end of destination block
;start the copy
   movem.l   (a0),d0-d7/a2-a7             ; load 56 bytes
   movem.l   d0-d7/a2-a7,(a1)             ; write 56 bytes
   movem.l   -1*56(a0),d0-d7/a2-a7        ; load 56 bytes
   movem.l   d0-d7/a2-a7,-(a1)            ; write 56 bytes
   movem.l   -2*56(a0),d0-d7/a2-a7        ; load
   movem.l   d0-d7/a2-a7,-(a1)            ; write
; ......
; until the whole block is moved
   movem.l   register_storage,d0-d7/a0-a7 ; restore registers
```

Notes:
*source and destination adresses have to be even.
*Because we are using the stack you can to this in user mode, or in supervisor

mode with the interupts disabled.
*You can use the routine to write a patern in memory by loading the registers with the right values and deleting the load statements. The routine will write 56 byte blocks so you patern size can be 56, 8, 7,
4, 2 or 1 byte(s).
*If you prepare your data the right way you can use a postincrement instruction ((a0)+) to load the data into the registers. Example, you can copy a screen into a buffer using (a0)+ for the load sequence. The data in the buffer will be 'scrambled'. But when you copy the data back into the screen using the same routine the data will be restored correct.
(move.b (a0)+,-(a1) will store the bytes reverse ordered at the destination adress, but when you copy the data back to the source using the same move.b (a1)+,-(a1) the data will be restored correctly.
Modifying the routine with a post increment source adress has the same effect, only this time 56 bytes blocks will be stored backward.)

I hope this gives you enough information to fix you bug.

>I've looked this up in both the Atari Compendium and the Lattice C docs
>as well as performing a search through all the Lattice C header files.
>I can't find any trace of this function. Help!

For MagiC (extracts from 2.0 manual intermingled with my waffle) ...

```
#define SHW_IMMED        0  /* PC-GEM 2.x  */
```

```
#define SHW_CHAIN        1  /* TOS         */
#define SHW_DOS          2  /* PC-GEM 2.x  */
#define SHW_PARALLEL     100     /* MagiC       */
#define SHW_SINGLE       101     /* MagiC       */
```

eg. shel_write(mode,gemflag,SHW_PARALLEL,exec,tail);

'gemflag' is usually passed as TRUE for a gem program. FALSE will launch a non gem program into a vt52.prg window for want of a better way to describe it. Have a look at SDUU to see this in action.

The relevent part of appl_getinfo() ...

Function 10:
word 1: available modi ...
     bits0..7 maximum value for sh_wdoex & 0xff.
     bits8..15 Bits from sh_wdoex & 0xff00 which are handled as in multitos.
word 2: 1: shel_write(0) makes previous shel_write() calls invalid (ie desktop becomes the successor) In Tos 1.4 & MagiC.
word 3: 1: shel_write(1) starts the program after termination of the current one (Tos 1.4 & MagiC).
     0: starts the program immediately (multitos).
word 4: ARGV via sh_wiscr() supported (1) or not (0).

As I do not have access to multitos I have made no attempt to be compatible with it. As such, I pass mode=1 currently.

Where did you hear this? Could be cool to run a 3D game at the same time as
Papyrus. :-)

I have tested Ikarus (3D world running in GEM) on my Afterburner040 and it's
actually realy nice (walking wireframe people, flying birds, cars etc.). Something
like this could be realy playable running in a GEM window on a decent machine.

Aloha...
I'd like to write some small custom programs for personal use... Some include simple midi programs...printer drivers...and the like... Also would like to delv a little into multi media type applications such as Music Tutorials...perhaps even relase a CD for Music Theory and Jazz Improv studies.

Basicly, I'd like to know if STOS would be a good package to use for this kind of stuff. It seems like it would be a great package for creating "educational" software since it must be pretty graphicly adept to handle arcade games! How does it score on using the various ports... I guess that's the key question. I can also invision some WAY COOL games that use a MIDI KEYBOARD as the input device rather than a joystick. Imagine having 64 to 88 keys to assign various functions! Not to meniton that most keyboards have at least one slider, a pedal, and those groovy wheel controlers!

A long time ago I purchased Mark Williams C for my old STf... It doesn't work on my Falcon...and I never learned to program in C anyway. I like the idea of using basic commands to call function libraries...does STOS allow this? I.E. could I find a module compiled from C, or Assembler, or whatever...and call for it/pass paramaters using STOS? If so...I'm assumeing the STOS compiler will let you mix different binary modules in the final compilation? This would ROCK!!! It'd be like having the flexability of C to call functions from various compiled modules...but being able to write the MAIN body of the program in BASIC (which I know fairly well syntex wise).

Note that the handle you get with graf_handle() is of the *physical*
workstation. The AES already did the v_opnwk(), which you would have to
do yourself if you want to use the VDI before the AES is started (eg. in
an auto folder program).

In general, the handle that you pass to v_opnvwk() must always be of the
physical workstation, as returned by v_opnwk().

Hmm... I'm sure I remember a number of lectures a couple of years ago where
a lecturer explained in (painful) detail how to convert both head and tail
recursive functions into a while loop (using temporary variables).

I could be wrong though... I'll check my notes...

>sort of stack emulation. Comming to that point I am sure it's faster to and more
>memory efficient to use the build in stack mechanism of the 68000.

Well, if you can avoid using a stack and repeated function calls you are
going to have a lot of memory accesses (=slow) and branches (=lots of
hard to pipeline code [not relevent to Atari's, AFAIK]), and as for
spacial efficiency, you have to have a large stack, otherwise you'll
get stack overflow...

>However most standard examples of recursion in programming courses are examples
>of 'false' recursion. A recursive algoritm to calculate x! is a well know
>example of false recursion. Those false recursions ca be rewritten as a while
>loop.

Yes, I know that some textbooks give stupid examples, but I have a vague
memory of a proof that it can (theoretically) be done for all cases...

>But tree traversel routines realy do need recursion. Like routine that outputs
>the data stored in a binary tree in order:

Certainly no obvious way...

>Most games don't need those more complex data structures and routines to
>handele them.

Correct - except for 3d games. (BSP trees, for example)

I seem to remember that there was a bug in the first version of STOS
which caused problems with garbage collection. IIRC this has been fixed
since about 1990.

:-)

> collections.

Ok... all variables (except arrays) are dynamically allocated on a heap and are global since STOS is not procedural. If you are doing a lot of string manipulation, there *will* be a lot of garbage getting built up. You can manually force a garbage collection at any time though to make sure that it doesn't occur at a bad time.

STOS reserves its memory banks from the top of memory downwards (ie. bank 15 will always be near the end). So all constant data should be put in higher banks and workspaces in lower banks if you are to be constantly reserving and deleting banks. When you delete or reserve a bank, STOS does a lot of work shifting the lower banks around...

The nice thing about banks is that you can use them for just about anything (I have even used them for storing strings >65535 characters long) and it is very easy to access them. Their best feature IMHO is that you can use them for including binary data in your programs eliminating all those horrible little files like you see with programs written in C. :)

I've never had any problem with garbage collections before, so he must have been doing something wrong :)

As far as I know you are right. There is no point in opening a virtual workstation more than once. The benefit of doing v_opnwkk is that you can get hold of all the parameters of the workstation in one call.

Yes. Look for Turbo Assembler by Omikron. It's PD now and works a treat. The
last version I have seen is 1.77. It is available with both English and
German RSC. It generally has file names like T_ASS, TASM177 etc.

 But where do you stop, suppose you have made your game, its running
at the speed you want, it looks as good as you envisaged, thats it
finished, why would i then want to add more speed?, maybe BASIC does
exactly the job I intended it to do?, I dont have this fixation with
speed that a lot of people seem to have, I envisage a game, make it,
and thats that, if it looks and plays as intended then ok?
 see heartland I just sent you, any more speed and it would look silly
?

 I am sure I made the point....BEST games, comeon surely you are not
suggesting text games are.....well this point could be debated as a
matter of taste,?

> > Neither do I, so surely that excludes them from the debate ?...next:)
>
>No, lets say they used a graphics library someone wrote. I think the amount of
>assembly code in Colonial Conquest is quit low because it runs on a TT and gets
>a great performance improvement from a screen
>accelerator.

But its assembly code, asm is asm, I use BASIC commands, I cant see
how you can say that something using assembler is in BASIC?, there has
to be a line somewhere, I mean you could say that because a BASIC

language was made in assembler then we are using assembler, you have
to stop somewhere,
 a game that has a source listing that consists ONLY of that
launguages BASIC commands is a BASIC program, if you then load in
assembly routines from outside? then its no longer basic is it ?

> > Yes they do don't they...and IMHO are STILL as usefull as a glass
> > brick?

>Just as games are?

 Games can give you a challenge, from the user point of view, what use
is a demo from a user point of view, a game can have an end result, a
high score table for instance, give the player a feeling of having
done something,
 for a programmer, a game and a demo are on a par, probably more goes
into the demo, so the use of a demo is the challenge to program, the
use of a game is the same, but has a use for the user, and although I
didnt make it plain at the time, I did mean that a demo had no use to
the user...well IMHO :)

> > Then how do you know its great and how do you come to the conclusion

>Well, I was not telling you it will be better than a STOS game, I was telling
>you they were making a great game in Gfa. I know it will be a great game because

>Yes, reading this newgroup I understand all works fine on a falcon as long as
>you write your own keyboard routines. No problem for you, you will call it a

 Wrong!....someone with a Falcon will have to back me up here, you can
write your own routines for joystick and keyboard, but you dont have
to, and unless its for some reason I dont know about then I cant think
why, possibly the guy who said this needed it because his routines
work after removing top and bottom borders, but for normal everyday
use, I can use STOS joystick and STOS keyboard commands and they will
work on the Falcon,

>upgrade (I would call it a cludge) and for a new piece of hardware you will have
>to wait untill someone cares to 'upgrade' your basic so you can use the new
>features, C however will produce working code for the new hardware.

 dont understand the term "cludge" but can imagine, are you implying
that having your preffered programming launguage updated as a matter
of progress, to keep up with the times , you mean thats a cludge?

>And what about the new Atari clones? Go back to start and try again?

 what about them, start what again, ALL tos versions can be supported, according to the programmers of the generic fixer, the only reason HADES etc was not included, was because he dident have access to one, or contact with anyone who has one so he can set up the tables, as soon as he has, then I wouldnt see a problem ?...but really? who would want a game on such a machine ?

>No, I am saying that writing a program that manly exists of peeks, pokes and
>memory moves is almost the same as writing the code in assembly. Only in
>assemply you call peek and poke move.

 yeagh, well almost dont hack it!...hehehe BASIC is BASIC, POKE is a valid BASIC command, simple as that IMHO

> > BTW Hans..do you have an STe? or FM? Can I send you one of my games
> > in return for the Demo you wrote ? <SMILE>
>
>I have got an 1040STf with 4Mb of memory. Please send me one of your games. But

 Sent, I look forward to your comments, and would you have instantly known it was BASIC :))

Cheers.....!ynoT

I have made a lot of programs and been involved with a lot of people
making programs in STOS, and had thousands of STOS problems pass
through STOSSER diskzine, NEVER have I seen anyone have garbage
collection problems using STOS 2.6.....

>STOS reserves its memory banks from the top of memory downwards (ie. bank

>higher banks and workspaces in lower banks if you are to be constantly
>reserving and deleting banks. When you delete or reserve a bank, STOS
>does a lot of work shifting the lower banks around...

This is true, I can place chip music, sampled sound, quartet and lots
of other sounds in bank 15, then load anything i want from disk or hd
into other banks and the music/sound or whatever goes uninterupted,
caused quite a stir when i had a mod playing while loading text files
from disk....about 2 years ago :)

>
>The nice thing about banks is that you can use them for just about
>anything (I have even used them for storing strings >65535 characters

I load a text file of ANY size into a bank, even packed text using
any of the regular packers on the ATARI then format it into strings,
are get the starting point of each line and put that into a string,
the former is better for search,print routines etc :)

>long) and it is very easy to access them. Their best feature IMHO is that
>you can use them for including binary data in your programs eliminating
>all those horrible little files like you see with programs written in C. :)

A problem with STOS is not being able to re-dim an arrayed variable,
you can place all the data you would normally place into a variable or
dimmed variables into a bank, you can use double and triple dimmed
arrays in stos, ie DIM(A,X,XX), but I havent managed more, but by
using a bank, you can access data with as many branches as you like,
by using a bank, you can then erase the bank and thus free the memory,
unlike using a dimmed array?

Cheers.....!ynoT

 Hang about!...the stos extensions are not "game libraries", they are
used in games yes, but are used as much in serious applications, look
at EXTRA, admittedly most commands are for games in some extensions,
but there are many others, look at all the disk copying, sector and
fingy stuff in misty,
 there are many uses for commands that at first would seem to be games
orientated, I have maestro installed, never use it for sampled sound,
but do use the datacopying command as it handles uneven sized chunks
of memory?...

Ah, but the the sentance above says 'when you can create your own
libaries' - ie if you can write extensions.

Gotcha! :-)

> So your average BASIC programmer uses the extensions as upgrades to
>STOS, thus he is still using STOS BASIC, albeit an updated version,

Yep, although are they used as much as in STOS? (I honestly dont know
about the other basics, but there are not many C Games programming
libraries [I know of only 1] publicly available for the Atari)

>>>with. (I have done that once, converting every routine that used more than 1%

of

Yep.

Yes, thats true. :-)

>>As I said - the lack of proper functions IS a limitation of STOS.
>
> Sorry Anthony, could you explain that last sentance, whats a proper
>function? and why does it limit STOS, although I am unsure of what you

Well, STOS doesn't have the ability to have a functions which are
effectively mini programs. They take input, and return output to
the main program. They can have local variables which cannot be
accessed from elsewhere, and may call other functions (including
itself)

eg. (this is C syntax, btw)

```
int function_1(int a,int b)
{
 int c;

 c=rand(); /* probably not right syntax, but dont flame me. I dont
              use random numbers in C all that often... */
 return (a+b+c);
}

main()
{
 int d,e,f,g;

 d=2;
 e=3;

 f=function_1(d,e);
```

```
 /* f now equals 2 + 3 + some random number */
 g=function_1(e,f);
 /* g now equals 3 + f + some random number */
}
```

So, When in the main function it cannot access any varables called
a,b and c, but when it calls function_1(d,e) varables a and b are
created with the values currently held in d and e. c is created
as well. These new variables disappear when function_1 reaches the
'return' statement.

>speak, I have to say that after over 50 releases, I have never felt
>limited in any way ?

Yes, it is a known problem. If you are not aware of a particular
way of programming, then you do not realise the use of it. Because
you haven't used 'real' functions you are not aware of the power
they give. This is how recursion (not possible without functions
like above, or simulated using a stack) was introduced by one
lecturer.

I'm not saying that STOS is bad because of this 'missing' ability,
as it can be used to do anything you can do in other languages.
It is just a different way of programming.

> INSTIGATING THE STOS AWARENESS CAMPAIGN :)

hehehe.... ;-)

Anthony

>would give the same back as in the opnvwk() ... ?!

graf_handle() returns the physical workstation handle which the system
obtained from the v_opnwk() it issued on gem bootup.

When you open a virtual workstation with v_opnvwk() you pass the

physical handle into it which is overwritten with the virtual one (or failure). Each virtual workstation has its own set of attributes.

The aes virtual handle is stored in the os header as of tos 1.4 up (I think, no docs to hand).

Toggle switches! Positively avant-garde. Bring back plugs and wires!
Nay, use a soldering iron (heated over an open fire of course). :-)

>As far as I know you are right. There is no point in opening a virtual
>workstation more than once. The benefit of doing v_opnwkk is that you
>can get hold of all the parameters of the workstation in one call.

Trivial example ...

```
font1(h)
{
 vst_alignment(h,0,0,..);
 vst_color(h,RED);
 vswr_mode(h,1);
 vst_font(h,font1);
 vst_point(h,point1,..);
}

font2(h)
{
 vst_alignment(h,0,5,..);
 vst_color(h,GREEN);
 vswr_mode(h,2);
 vst_font(h,font2);
 vst_point(h,point2,..);
}
```

Use of one workstation means code like this...

```
loop {
     font1(h);v_gtext(h);
     font2(h);v_gtext(h);
}endloop;
```

Use of two workstations lets you ..

```
font1(h[0]);
font2(h[1]);
loop {
     v_gtext(h[0]);
     v_gtext(h[1]);
}endloop;
```

:-)

If you are truly VDI-phobic, you can do a surprising number of things without invoking VDI at all, including simple windowed text. For that you can create an F_TEXT OBJECT to use over and over; to print something, assign your string to the object, set ob_x and ob_y, then do an objc_draw. Besides not having to open a workstation to do this, it seems to simplify the management of clipping rectangles and such.

Once when I was struggling with VDI calls in the writing of my first full GEM app, I tried converting all output to AES object draws like this. It worked, but ran very slowly. I ended up biting the bullet and going back to VDI.

An application need not display anything on the screen. Most do, however.

>I'd like to see the ability to simply double-click on, say, a WAV file and
>have it play through an "extended OS" which doesn't use any screen memory at
>all. Such an extension ot the OS would, I imagine, have to load in the AUTO

Screen memory? I am unsure what you mean here.

If you are refering to the memory where the current screen is stored (also
known as "video RAM"), applications do not allocate their own video RAM
anyway.

So what do you mean?

The effect you want is obtainable by using the "Install Application" option
in the GEM desktop (or the equivalent in an alternative desktop).

I get the feeling I must be missing the point of your idea, however. So please
correct me if my comments don't make any sense.

One thing that relates to this, however, is that when I have a shell script
that starts with, say, "#!/bin/tcsh", tcsh is not started when I double-click
on the item on the desktop. Instead, nothing happens (in the case of Thing)
or the file gets displayed to the screen (in the case of the GEM desktop).
Is this what you are referring to? And even if not, is there any way around
the problem?

IC magazine is a UK based fortnightly printed Atari publication. It is now in
it's
fifth issue and sold throughout Europe, and is soon to expand to cover the Oases/
Omen

platform.

Is there anything I, as editor, can do to help the programmers of the Atari community?
If anyone out there wants to run a section, occassionally or regularly, that you feel
would help fellore programmers, or if you have any other ideas as to how this newsletter
could help Atari programmers, please contact me immediately.

Also please contact me if you'd like more info about the newsletter.

Please reply this message by email, and not through newsgroup messages.

Thanks for your time,
Matthew Townsend.

>it's a lot cheaper for me to get large amounts of data on that adres. I will
>send you my demo.

OK hopefully you have mangaed to have a good looksy at the game i sent you..its all in basic and the actual source could be viewed in a text editor, ie no machine code etc,

I got your demo done in BASIC, Yes definatly impressed, some of the screens can easilly be done in other BASICs now...I say now, because I think the one you sent me isnt recent, therefore is even more impressive,
Loved the main menu...very nice,

The most impressive screen and the one that easilly stood out was the circle scroller type demo, this is excellent, I have seen circle scrollers in basic, but there where done with line, letters, eeerm drawn using the line command, nothing however as impressive or as smooth as yours,

All this is made even more impressive by the fact that the sound is being replayed not by machine code routines but by your own routines written in the program, thats something I could not do....but then again dont need to :)

Yes impressed by your demo in BASIC...but it doesent alter my opinion that STOS is the best BASIC for making games at this moment in time?:)

Cheers.....!ynoT

OK guys same question as I ask on a regular basis, just hopeing that maybe some new blood in the group may be able to answer,

Has anyone got HIGHSOFT BASIC 2, can you send me some simple examples and maybe..hopefully a command listing,
I have the copy from the atari world cover disk, but no commands, no source,

Added question, how do you call the fileselctor from HSB2
how do you retrive the command line info

Is no one using this package yet ?

please please can you refrain from the usual answers, if i could afford a manual, from highsoft then i would buy one, if i wanted gfa then i would get it, what i am after, is what i am asking, that simple?,

PLEASE can someone help <BIG smile>

Yea, ok, point taken. What I meant was that I only know of one C library that has useful things like sprite drawing, block copying etc. (excluding using the standard GEM/VDI libraries - who would use VDI for a scroller? Line-a, yes... [but incompatible :)]

We are, afterall talking about games programming, not demos, or apps or anything else, aren't we? :)

Partially. It sort of provides this functionality, but not terribly well.
Aren't you effectively limited to a one line function? (I've only used
it once, so dont flame me if I'm wrong. :))

reply-to: J.B.W.Webber@ukc.ac.uk (jbww)
newsgroups: comp.sys.atari.programmer

I have not been following this group for a while, so excuse me
if this has already been dealt with.

I think the following small change may be a fix for some gem calls
in the 32 bit mode, to the Atari gem library Patchlevel 31.

I was re-visiting some code I last compiled with the old Alcyon compiler,
and was trying it under gcc. Things were OK using -mshort,
but I was having problems I did not understand with 32 bit ints.

In particular, for the appended short test progran scn.c,
wind_get was not returning sensible values with 32 bit ints.

I moved a copy of wind_get into scn.c, and made the following small change
to common.h - after this wind_get returned sensible values in both modes.

```
#define _control   (&_contrl[0])
#define _int_in        (&_intin[0])
/*
#define _int_out   ((int *)(&_intout[0]))
 */
#define _int_out   (&_intout[0])      /* jbww@ukc.ac.uk 96_11 */
#define _addrin        ((void **)(&_ptsin[0]))
#define _addrout   ((void **)(&_ptsout[0]))
```

The impetus to get things working in 32 bit mode comes from the fact
that pml seems to have some problems with mshort - is this expected ?
In particular, exp breaks, that my code uses.

I got round this by compiling :

```
     gcc -mshort -c graph.c ; gcc graph.o -lgem16 -lpml
```

but mow with the re-built gem.olb, the following works :

```
     gcc graph.c -lgem -lpml
```

graph.c exercises open and close virtual workstation, sizer, fuller, mover,
closer; has a fairly lengthy evnt_multi section, and all seems to work OK
in both 16 and 32 bit modes now, with wind_get now OK.

The only change to graph.c from the Alcyon code, is to evnt_multi
where the two parameters following msgbuf become one :

```
unsigned long interval=(unsigned long)0;  /* was two ints
         */
```

 If you know of any other fixes I might need, I would be glad to have them.

cheers
     beau webber

Here follows scn.c, to test the fix :

```
/*********************************************************************/
/*       show screen facts  J.B.W.Webber 96_11_16       */
/*   gcc scn.c -lgem                                 */
/*   gcc -mshort scn.c -lgem16                       */
/*   needs intout fix to common.h                         */
/*********************************************************************/

/*********************************************************************/
/* INCLUDE FILES                                                     */
```

```
/*****************************************************************/

#include "stdio.h"
#include "osbind.h"
#include "aesbind.h"
#include "common.h"

int wind_getM(int WindowHandle, int What,
          int *W1, int *W2, int *W3, int *W4)
{
    int retval;

    _int_in[0] = WindowHandle;
    _int_in[1] = What;

    retval = __aes__(AES_CONTROL_ENCODE(104, 2, 5, 0));

    *W1 = _int_out[1];
    *W2 = _int_out[2];
    *W3 = _int_out[3];
    *W4 = _int_out[4];

/*
    printf("1 : %d\n",_int_out[1]);
    printf("2 : %d\n",_int_out[2]);
    printf("3 : %d\n",_int_out[3]);
    printf("4 : %d\n",_int_out[4]);
 */

    return retval;
}

main()
{
int  xdesk, ydesk, hdesk, wdesk;/* desktop x,y posn, height,width */
unsigned short Scn[2] ;     /* upper/lower 16 bits of screen address */

  printf (" screen : %p \n", Logbase() );

  Scn[0] = (unsigned short)(((long)Logbase()) >> 16) ;
  Scn[1] = (unsigned short)(long)Logbase() ;
  printf (" screen upper : %d \n", Scn[0]);
  printf (" screen lower : %d \n", Scn[1]);

  printf (" screen res : %d \n", Getrez() );

      wind_getM(0, WF_WORKXYWH, &xdesk, &ydesk, &wdesk, &hdesk);

  printf (" screen posn : %d %d \n", xdesk, ydesk);
  printf (" screen size : %d %d \n", wdesk, hdesk);
}

reply-to: J.B.W.Webber@ukc.ac.uk (jbww)
newsgroups: comp.sys.atari.programmer

I have been sucsessful in raster copying from one are of the screen
to another, using vro_cpyfm, by first defining a Memory Form Definition
Block for the screen, and the pxyarray defining the areas to be affects.

However what I want to do is copy in/out of linear memory, from/to the
screen.

My understanding is that I have to define a MFDB for the memory with
one single long line (and appropriate pxyarray), with mode 0, then call

```
vr_trnfm( handle, psrcMFDB, pdesMFDB)
```

What little docs I have implies that, copying from memory to screen,
the mode will be toggled and placed in the destination mode. This does not
happen. I realise I fail to understand what vr_trnfm is actually supposed to
do to what.

When I go on to call vro_cpyfm, to copy from memory (all set to 0x5555, to
give grey) to the screen, I get a single line where I expect to copy to,
and the top of the screen few rasters (in the menu bar) goes grey.

any help is appreciated.

cheers

Well, you can already do this with the desktop. What you need are a set of "clickies", and you install these clickies to load and display/play files. You do that with the "Install Apllication" option under the Atari desktop and all replacement desktops have a similar (usually more poewrful) version.

Currently I have clickies installed for MODs, WAVs, FLIs, MPGs, JPGs, GIFs and TGAs. Works a treat :)

The main advantage is they're not resident programs, therefore they don't tie up memory!

Neil.

One thing to be concerned about, though, relates to backward compatibility. Even though many people these days are using NVDI and other replacements for the VDI, it is worth noting that TOS, by itself, has a static limit on the total number of workstation handles. I seem to recall from testing early on that it was around 20 or so. After this point the v_opnvwk() call will fail.

Using too many workstations in one program will make this limit apparent more quickly, especially if the user is multitasking.

I think the best is turbo assembler 1.7.6 (or 1.7.7 I am not sure on what's the last version. It's fast, has a great debugger (bugaboo) and is realy good in

finding optimisations in you code (conversions of bra in bra.s and move.w adress,d0 into move.w adress(pc),d0 etc.

I think it's available on most Atari ftp sites, but also on most BBS's like Bearbord BBS.

Agreed. Except that STOS games generally don't work on the higher-end hardware without patching (and even then its a bit dodgy). At least with GEM games they (should) work on all versions of ST and derivatives.

I like STOS a lot and used to write in it all the time (not just games) but it really doesn't work on a Falcon and so I haven't used it for about two years. I was disappointed about that.

<cough, cough>

I beg to differ... STOS does work very nicely on the Falcon - once it
is set up properly. Using appropriate extensions you have full access
to the Falcons extra hardware etc. The only drawback is that it must
be run in an ST compatible resolution (HI as well - you can switch to
/ from ST High with my extension) as the editor/interpreter is not

designed for high-resolution modes.

:-)

 Crikey did I write that hahahaha...anyway its TRUE:)

>Agreed. Except that STOS games generally don't work on the higher-end
>hardware without patching (and even then its a bit dodgy). At least
>with GEM games they (should) work on all versions of ST and derivatives.

 Ok 2 points....No one makes decent games in GEM, certainly not fully
fledged platformers etc, I am talking about 1996 onwards, I am not
aware of anyone even contemplating such a thing?
 Secondly, You can now fix your compiler, this means the games you
compile will be fixed to work on any TOS versions you want, Including
all the Falcon versions, you have to follow a few programming
guidlines, things like not switching resolution anymore?, but if you
own a Falcon then I would say STOS is exactly what you need,

>I like STOS a lot and used to write in it all the time (not just games)

 Same here, Diskzine shells, text readers, multimedia kit, I have
released allsorts of stuff in STOS,

>but it really doesn't work on a Falcon and so I haven't used it for
>about two years. I was disappointed about that.

 AAAARGH what doesent work??? STOS not only works but there are now
upgrades (extensions) that allow you to access falcon specific stuff,
true colour sprites? and and and...ho just everything Falcon,

  If you have a Falcon and want to program, visit my page and look at

the file site, here you can link to Anthonys Falcon extension and
Generic fixer and much more,

STOS works great on the Falcon and now takes full advantage of
everything the Falcon has to offfer...How I wish I had a Falcon:)

Sorry to rant, but its a pet hate of mine, how people tried STOS
years ago, formed an opinion, and decide thats that, THINGS GET
UPGRADED but people prefer to think what STOS used to be like ???????

STOS has been upgraded!!!!!!!! see the STOS.FAQ

<smile>

Cheers.....!ynoT

programming an AES-GEM application and being quite lazy
i asked myself if it's necessary (and when: why ?)
to open another virtual workstation if i could use the workstation
of the desktop and therefore just make an appl_init() and
a graf_handle() to work with GEM-windows and AES ?!
any advices ?

Ok...

here is what you do:

install STOS.
---
install files on you HD
run Generic STOS Fixer on BASIC206.PRG
rename to BASIC206.TOS (improves graphics commands)
put fgraphic.exx and faudio.exy in STOS\ folder
run from ST-low (no NVDI... control boot is safest)

The STOS editor should now work.

install compiler
---
install files on you HD
fix (MUST use a Generic fixer) COMP207.BIN
put fgraphic.ecx and faudio.ecy in COMPILER\ folder
compile a program
run it from ST-low (control-boot)

read the manual to Generic STOS Fixer for details on compatibility
issues. Read the manual to STOS Falcon extension for details about
Falcon only commands.

Both are available on the WWW at my pages, or via FTP somewhere...

Falcon extension is shareware, of course...

Anthony

There is only one MT safe AES library. I wrote MT_AES.LIB when I
introduced threads (in the UNIX meaning, i.e. one process can have
many threads) in MagiC 5.
Any other AES library will cause crashes.

> No. (lots)

Help me out here will you. I take it from "No" you disagree with what I have said. An explanation as to why might have helped. I'll be the first to admit I'm not the world's greatest GEM programmer and in the absence of any MagiC programming documentation that I can read, I can only go by my own experience.

When I wrote MultiPlicity it worked perfectly under single-TOS (using Pexec) MultiTOS and Geneva (using shel_write() mode 0). I bought MagiC 4 when it became available and MultiPlicity wouldn't call external programs under it. This was because shel_write() in mode 0 did not work under MagiC 4. I haven't tried it under v5 since the AES is still 3.99 and therefore I assume that no changes have been made here. I spent two weeks trying to get MagiC to behave as I expected it to before opting for the AV solution.

Lets be honest here. MultiPlicity was written as my final year project at university. Its primary function was to get me good marks and a good degree (which it did). The two lecturers whose job it was to assess my project only knew as much about Atari computing as I told them. I could therefore have got away with demonstrating MultiPlicity under Geneva and made NO attempt to get it work with MagiC and still have got the same mark. It was important to ME though it worked under MagiC which is why I spent time I could ill afford trying to make it do so. I readily admitted in the docs that my answer was not a solution but a workaround and I would continue to look for something better. I haven't found it yet but you are talking as you know the answer but just don't want to share it. If you really do how to do this then I would appreciate your help. Even if you don't, please try to substantiate your claims with something more than arrogance.

Incidently, why should I want to lie about MagiC? I don't have a

warehouse full of alternatives that I can't shift and trying to
discredit any Atari software does no one any good. I am simply stating
what I see to be the truth. With one or two caveats I think MagiC is
wonderful - it's just not perfect and I don't see why I shouldn't be
allowed to state that. On the shel_write() issue I would be quite happy
to proven wrong since it would solve a lot of problems. I don't like
the AV workaround any more than you for the reasons previously stated.

Regards
Martyn

It is very imprtant to do a correct init and not using the desktops.
If your program is using the desktops handle

and then if your program crash it will probably hang the system.
And it is not a clean way to program.

If you are going to use the VDI at all, you should always open your own
workstation. It is not, strictly speaking, necessary, but it is a very
good practice. It may even be required under MultiTOS, if I recall
correctly.

If you don't use any VDI calls (or only things like v_show_c(), which
don't alter any workstation attributes), there's no need to open a new
workstation.

: under MagiC 4.

No, this is because you called shel_write with mode 0 instead of shel_write with mode 1 like in Single TOS. You made the assumption that anything except Single TOS uses mode 0 like MultiTOS. And this assumption was wrong. appl_getinfo() clearly tells you that MagiC's mode 0 works like in TOS, not in MultiTOS. So your program should have used mode 1 as it does with Single TOS.

: help. Even if you don't, please try to substantiate your claims with
: something more than arrogance.

Don't you think it is arrogant not to distinguish between assumptions and facts and to tell here that something does not work instead of asking what you might have done wrong?

This is not a very good idea in many senses.
All settings, such as line colour, width, style, marker colour, size etc. etc. will be saved and used by the desktop as well. And if your program is running as an accessory, it and the desktop would both change the settings, and VERY unexpected result will happen.

There's probably a lot more reasons not to do it that way, and besides, it's not really that much work to do a v_opnvwk.

Depends on your definition of making games... STOS comes with a great set of general usable routines for games, but if you want to make your games the best of the best you have to design your own specific routines.
If you get to that point C is the most flexible solution, I think, but you have to do all your grapic and sound routines yourself because there is no standard library for graphics work.

If it comes to basic I prefer Omikron basic. Ever seen my Demounstures demo vor ST/STe? It realy beats the hell out of all other basic demos I have ever seen. Considering making demos is about as hard as making games I think your statement is proven to be wrong. ;-)

Bye Hans Wessels

BTW: use assembly to do real work and make the framework in C!

Hans

I think this sounds just like Andreas. You can't comment on MagiC without he jumping on you, saying that MagiC is best. If MagiC can't do it, don't do it. Great. If you are realy lucky he wil leven say two words!

As Andreas should know about most questions asked here it shouldn't be that damned hard to answer them insteed of being arrogant, becuase that he is!

We all love/like MagiC, but we find some shortcommings from time to time. Why not try to fix them insteed? The guy who is doing Geneva (sorry I can't remeber his name right now) seems to be much more helpfull and if there is something missing, or like with the new AES calles that some guys come up with for XaAES/oAESis, quickly picked them up and add them. With MagiC you don't get much respons. You only have to upgrade three times per year to get some more pointless features insteed of AES 4.1 compatibility.

What I would like to see in MagiC before they start playing with VFAT and other stupied things would be _true_ AES 4.1 support and better memory protection which would make it alot more stable. It's a great OS, but it's not perfect, but there isn't anythinkg saying that it couldn't be.

I must say that I like MagiC very much. Anything else would be a lie but I want my toolbars.... :-)

Yeah, sorry. I must say that I had problems understanding that my self...

TINWIS. Paraphrasing a little, I said that the MagiC AES is not fully
AES 4 compliant (which it isn't) and one of the missing parts was
shel_write() in mode 0 (which it is).
It doesn't matter whether it made sense the way Atari did it. The fact
is that Atari were the originators of the OS and any replacement for
that OS must do things the same way (at least at programmer interface
level) or risk programs that worked perfectly under TOS not working
under the replacement. Like it or not TOS is the standard.

>
Like I said, MagiC does not use shel_write() in mode 0. Thanks for the
info on mode 1 though. I'll try it. I have since looked up this call
and got conflicting stories - though the end result is the same.
According to the Atari Compendium mode 0 was introduced with AES 4 and
should not be used with AES versions lower than this. The Lattice C
docs state that mode 0 is theoretically available for all versions of
AES but a bug in every version of the AES up to 4 means that it doesn't
work.

> you might have done wrong?
>
No. As far as I am concerned I followed Atari's programming instructions

for a multitasking system. The fact that it worked without problem under both Atari's official multitasking system and Geneva is testement to that. The lack of any decent documentation for MagiC means that I only have two other ways of finding things out about the system: Asking the UK distributors, System Solutions; and my own observations. I observed that shel_write() mode 0 did not operate under MagiC and a phone call to SysSol for help confirmed that. I was perfectly correct to state that mode 0 did not work and that the MagiC AES is not fully AES 4 compliant. Where, perhaps, I didn't make myself clear was in saying that I had used AV to get round the problem without stating that I was aware that it wasn't the best solution. I was just trying to be concise.

Agreed. Dan Wilga (for that is his name) is extremely good when it comes to support. When I first got my Falcon I found that Geneva TOS no longer worked (I should point out that this was a few Geneva versions ago). Within 24 hours Dan had come back with a way to fix the problem. That's service!

VFAT is very nice but really more trouble than it's worth. Kobold
doesn't understand long file names and doesn't default to to the
shortened versions (though I guess this might change with v4) and disk
maintenance on VFAT partitions is a thing of the past. Plus I then have
to put up with Diamond Mirror telling me that the VFAT partition is
faulty. I realise that this is older software not understanding VFAT
but I have no removed it from all partitions.

Yup - my latest is "Bomb Squad" for the Falcon 030 (and STe soon).
Check it out at http://student.canberra.edu.au/~u943409/bomb_squad.html
or d/load it from the major ftp sites...

Planning to convert some good-ol' atari 8-bit games during the summer
break from university...

I plan to support the Falcon and STe as it is quite easy to adapt code
from Falcon to STe and vice-versa. Most stuff I write will require >1Mb
RAM though - but STes are *SO* easy to upgrade any 1Mb owner should spend
$20 or so and get 4Mb RAM...

Seeya,
Yiannis

I've looked this up in both the Atari Compendium and the Lattice C docs
as well as performing a search through all the Lattice C header files.
I can't find any trace of this function. Help!

 Theres isnt much leeway is there? making games means making games,

>general usable routines for games, but if you want to make your games the best
>of the best you have to design your own specific routines.

 What? I do design my own routines, In BASIC?.... I (and no one else
should) ever use any of the original STOS routines, they are,slow
,stupid and for the most part unusable

>If you get to that point C is the most flexible solution, I think, but you have
>to do all your grapic and sound routines yourself because there is no standard
>library for graphics work.

 Sorry but I do not understand your point here, I am debating the best
programming launguage for making games, between ANY BASIC and C, yet
you seem to be telling me how awkward to use C is,
 Show me a top game made in C ? something thats better than one I can
show you in STOS?

>If it comes to basic I prefer Omikron basic. Ever seen my Demounstures demo vor
>ST/STe? It realy beats the hell out of all other basic demos I have ever seen.
>Considering making demos is about as hard as making games I think your statement
>is proven to be wrong. ;-)

 Demos are hard to make, and about as usefull as a glass brick,

 Dont show me demos, show me a game made in BASIC that is better than
any I can show you made in STOS BASIC,
 Show me a game currently being made NOW in BASIC that beats any I can
show you currently being made in STOS,
 Demos are not games...
 You have not proved me wrong at all, more like tried to twist the
challenge,

>BTW: use assembly to do real work and make the framework in C!

 real work, hahahahahahahahahahahahahaha did you not understand my
original question?

 Anyone else out there who wants to debate the point that I say STOS
is the best BASIC for making games, without talking Demos=not games

and without suggesting Assembly....real work my foot

< BIG SMILE >

BTW Yes Assembly is more powerfull (and less fun) but then again,
thats why I did NOT include it in the challenge ?

Cheers.....!ynoT

Hi there!

After the discussion has been going on for a while in the cbm newsgroups,
I decided to ask other people what they think about it.

I have designed a 6502 relocatable binary file format binary. This
format is preliminary and I'm still collecting ideas as how to
make it more useful.
I also have an assembler (written in ANSI-C) that can produce this
format.

But first I like to here your comments, esp. what you think about
the usefulness for an 65816, as I don't have any info on this one.

Thanks
Andr

----------snip----------

6502 binary relocation format V0.9, as of 02nov1996

(c) Andr⸮ Fachat (a.fachat@physik.tu-chemnitz.de)

0) What it's for?

With some new 6502/C64/C128 operating systems comes the need for a new binary format that allows relocating an assembly language program to a different location.

This text tries to find a) a good solution to this problem for the 6502 CPU and b) an assembler source format to use this format in a general manner. It doesn't try to define or discuss object file or library file format, which can be implemented differently by different assemblers.

1) 6502 specifics

The 6502 has the special feature of a 'zeropage', i.e. a very limited memory address range used for special addressing modes. So the format should not only provide a means to relocate absolute addresses but also zeropage addresses.

The stack is also very limited. A binary format should provide a measure of how much stack space is needed for the application.
An issue still to be discussed should be if stack addresses should be relocated and how. The C64 basic interpreter uses a lot of the stack, for example. But I tend to leave the (limited) stack for its real purpose, as stack!

Such limits should be defined as 2 byte values, even if the 6502 only has a range of 1 byte. But the 65816 behaves differently (?).

Another problem is, that an address can be 'split', i.e. you can just use the high byte or the low byte separately in an opcode. This gives need to a special relocation table format, that can cope with half-address references.

2) assembler source format (as of xa-2.1.0d, 02nov1996)

As already used in other formats, the assembler uses three different segment types, i.e. text (the actual program code), data (initialized variables), and bss (uninitialized variables). In addition to that, the 6502 format also includes a zeropage segment type, to allow zeropage variables to be relocated. This zeropage segment is like a bss segment, in that only the length, but not the data is saved.

In 2.1.0 there is a way to temporarily disable the creation of relocation table entries. This way absolute code can be inserted into a file. This code should then be copied to the right location at runtime.
(Later versions will also provide a way to 'embed' relocatable files

in an absolutely addressed code. At least I want to build some operating system ROMs with that...)

2.1) allocation of data segment/zeropage segment address space

The assembler switches between the different segments by the means of ".text", ".data", ".bss" and ".zero" pseudo opcodes.
The text segment contains the program code. Data holds the initialized data, while bss and zero segments contain uninitialized data for normal/zeropage address space.
Everything that is between one of these segment opcodes and the next segment opcode gets into the corresponding segment, i.e. labels, assembled code etc.
The text and data segments are saved in the file, while for the bss and zero segments only the length is saved in the file.

2.2) referencing data/bss/zeropage addresses

One problem with the 6502 is, that it cannot load an address within one step or assembler opcode. So an address is loaded with standard byte opcodes, like "lda #<label". But how do we decide, whether "label" is an address or not, and what do we if we get something like "lda #zp_label + 12 * label2"?

The assembler is now intelligent enough to evaluate such expressions and check for:

- no address label : ok, absolute
- one address label, only add to label : ok, relocate
- difference between two addresses : If addresses in same segment, compute diff and set absolute, otherwise bail
- everything else : warning

This way there is no change in syntax. Address labels are distinguished by using the "label:" syntax, as opposed to "label = value". Well, my assembler can also use the first syntax without the colon, as here everything is a label that is not an assembler opcode.

3) binary format

I have seen three ways to handle the relocation problem so far:

- tables: have a relocation table for a text segment
  if relocation table is put in front of code (as braindead MS-DOS does) you have to save the table in a side-storage
  if table is behind, you still cannot relocate 'on the fly'.

- deassembling: go through the code, deassemble it and change all absolute addresses. Problem: needs to know / have hints about where some data is in the code.

- relocation info in the code: Here each address is preceeded with an 'escape' code and is relocated when loading. But this disallows block oriented

transfer from storage media to memory.

I therefore prefer the first method, with the table after the code/data. So I can use block oriented transfer for the text/data segment. And while reading the relocation tables bytewise, the relocation can be done without the need to save the table somewhere.

The proposed standard extension for the described format is ".o65".

The binary format is the following:

```
-----------------------------------------------------------------
header
     .byt $01      ; version
     .byt $00      ; non-C64 marker
     .word tbase        ; address to which text is assembled to
                   ; originally
     .word tlen         ; length of text segment
     .word dbase        ; originating address for data segment
     .word dlen         ; length of data segment
     .word bbase        ; originating address for bss segment
     .word blen         ; length of bss segment
     .word zbase        ; originating address for zero segment
     .word zlen         ; length of zero segment

     {             ; optional options, more than one allowed
     .byt olen     ; overall length (including length and type
                   ; byte
     .byt otype         ; option type
     [ .byt option_bytes ]
     }+
     .byt $00      ; end of options marker (i.e. option len=0)

text               ; text segment
data               ; data segment

reloc_text             ; relocation table for text segment
reloc_data             ; relocation table for data segment
external           ; list of external references
globals                ; list of global variables
-----------------------------------------------------------------
```

The header options currently defined/proposed are:

- Filename
  type=0; len=[variable]; content=string,0

- Adrlist
  type=1; len=[variable]; content= address pointer list
  The addresses are relocated as if they point to the text segment
  An OS might use this as general jump table (may be for libraries?).
  But It's better to have an own jump table for each OS; that would even
  allow one binary for multiple OSes (like OS/A65-Adrlist -> init adr,

```
  Lunix-Adrlist -> init-adr, list of exception vectors etc...)
  (Should I drop this one?)

- StackSize
  type=2; len=4; content= data word describing the minimum needed stack size.
  The OS should add an appropriate value for it's IRQ routines and stuff.
```

The text and data segments are just the assembled code.

The relocation tables are (each):

```
{ [255,...,255,] offset of next relocation (b), typebyte|segmentID [, low_byte] }+
```

where typebyte is one of

```
WORD $80  2 byte address
HIGH $40  high byte of an address
LOW  $20  low byte of an address
```

and segmentID stands for the segment the reference points to:

```
0        absolute value
1        text segment
2        data segment
3        bss segment
4        zero segment
```

The offset is a one byte value only. If the difference between the last relocation address and the next one is larger than 254, a 255 is put in the offset byte, and 254 is substracted from the difference, thus allowing to continue without a zero offset byte.
A zero offset byte ends the relocation table. The first offset is computed from the segment base address-1, to avoid a 0 value in the first entry.

A format for the external refernces list (i.e. a list of undefined references) is not (yet) defined

---

The global list is:

```
{ "global_label_name_in_asc",0, segmentID, value.w }+
.byt $00
```

This approach allows

 a) using BLOCK transfers, as no relocation info is hidden within the

```
    code or data itself;
 b) It needs no (not much) side-storage, as a segment can be read using block
    transfers and then, while reading the relocation table, being
    relocated on the fly. The only side-storage is the list of segments
    with corresponding memory offsets. See the provided basic 'loader'
    code.

----------------------------------------------------------------

Possible Changes to the format are:

- put the minimum stack size into the file header, not into an option

- have an additional byte to flag that the relocation table only allows
  pagewise relocation. Well, this would insert a word at position 2
  (i.e. after the initial .byt 1,0 and before the text segment base address.)
  The flag would then be one out of 16 possible databits.
  [This change has a high probability, I think....]

- Have possibly multiple objects in one file

- add a "static data init" function address header option that gets
  called after loading but before the thing is executed. This could
  make runtime linking easier, when each object is one function and not
  a whole program.

I guess you ment "now removed"? Actaully I'm thinking of removing it as
well. As you said, it realy make more trouble than it's worth. :-\

I actually havn't got one file with more charachters than 8+3 as they
get wacky under TOS and I use TOS regulary as well.. :-)

Argh!

You mention library routines for C, yet not for STOS! You do not have to use
the standard STOS sprites - in fact most (good) STOS programs DO NOT use the
STOS sprites (or music, or joystick or...) routines. They use library routines
which are much more efficient. These are called extensions BTW, and there are
LOTS of them (check the STOS FAQ for info on what is available).

If you still dont think it is fast enough then you can write your routines
in assembly language and use them within STOS as has been shown by eg. BombSquad
which does exactly this.

I am not saying that STOS is better than other languages (I have used quite
a few, and do find STOS one of the easiest to write complex programs in) but
I would say that it is wrong to assume that STOS is not as good as C for the
reasons mentioned above. (one valid reason might be the lack of proper functions,
but these can easily be simulated with gosubs)

Looking at your code yep.

Place this before Form_dial(FMD_START,

```
wind_update(BEG_UPDATE);
wind_update(BEG_MCTRL);
```

which looks the screen for your use.

and this after FMD_FINISH, to unlock it.

```
wind_update(END_MCTRL);
wind_update(END_UPDATE);
```

See you earlier,

Steven

>any advices ?

Each vdi handle identifies a structure which holds the current
attributes. If you use the aes handle then any changes you make will
may also affect the "desktop" and vice-versa. Even if a particular
operation appears to be ok you cannot guarantee it will be so in any
other context. Thus it's a bad idea.

Part of the vdi idea is it allows you to open multiple workstations
with different attributes. Instead of having to keep changing the
attributes all you need do is change handles.

Yes! and cars are cars, there is no difference between a Mercedes, Fiat and Lada!

> What? I do design my own routines, In BASIC?.... I (and no one else
> should) ever use any of the original STOS routines, they are,slow
> ,stupid and for the most part unusable

No, a midrange car brings you to every place you want. If you want maimum prestations you have to tune and modify your car...

> Sorry but I do not understand your point here, I am debating the best
> programming launguage for making games, between ANY BASIC and C, yet
> you seem to be telling me how awkward to use C is,

or even design and build your own one. It's far more work, it's hard work, but the result might be far better than a regular care made of standard parts.

> Show me a top game made in C ? something thats better than one I can
> show you in STOS?

Civilization is done in C and Colonial conquest too. I don't know the amount of assembly that's used in those projects. It's quite easy to design your code in C and optimise the most used and most time consuming parts in assembly (I use that method in my current projects). I think most simulation games like (Railroad Tycoon, Simcity) are done in C with maybe some assembly. Oxyd is done in Modula 2.

> Demos are hard to make, and about as usefull as a glass brick,

They show you the limit of the computer in combination with a certain language

and the imagination of the coders.

> Dont show me demos, show me a game made in BASIC that is better than
> any I can show you made in STOS BASIC,

I can't. Most games I know of are written is assembly (maybe C, you have to step down to the Basic level to see anything like 'sorry for the worse gameplay, but it was written in basic;. ;-))

> Show me a game currently being made NOW in BASIC that beats any I can
> show you currently being made in STOS,

FUN ((ex)DBA) is working on a great game in Gfa Basic. I haven't tested it yet nor have I seen any STOS games lately (the last time I have tried a STOS game I had to switch TOS version, in that time (long, long ago) STOS crashed on TOS 1.04.

> BTW Yes Assembly is more powerfull (and less fun) but then again,
> thats why I did NOT include it in the challenge ?

So, there is the point I am trying to make. Writing games in assembly is very hard, but you can get the best results. In C it might be somewhat less difficult, but at the same time you can't reach the best assembly level. In STOS basic on the other hand, there are a lot of easy to use routines to do the hard grafix work for you (and to paly samples and so on) but at the same time you lose the absolute command over your code. To reclaim the absolute command you have to write all the impartant routines yourself. When you get to that point there is no significant difference between the various basic dialects and you are writing assembly code in basic (lots of pokes and memory moves, clockcycle counting and
preshifting of sprites). Maybe I am thing too much as democoder on this point.

Bye, Hans Wessels

Nope, I was telling you the standard C library is not usable for game design and that you had to create your own library. When you can create your own libraries it doesn't matter anymore wich language you choose to write the game framework in. Most mordern languages allow you to call external routines in a more or less easy way.

> If you still dont think it is fast enough then you can write your
> routines in assembly language and use them within STOS as has been
> shown by eg. BombSquad which does exactly this.

So it ends in a game where al the main game routines are assebly and only some disk routines and initialisation is done in the original language you started with. (I have done that once, converting every routine that used more than 1% of the total execution time to assembly.)

> not as good as C for the reasons mentioned above. (one valid reason
> might be the lack of proper functions,
> but these can easily be simulated with gosubs)

I hope you can declare some local variables after your gosub labels, otherwise you are in BIG trouble when you are calling the routine recursively. (For examble when you are generating a random maze or chacking there is still a way out of the current maze.)

Bye, Hans

Who knows about GFA Basic on ATARI ST?
I wrote a program with Assembler Code included (poke into RAM from DATA lines). It works perfectly in the interpreter mode, compiles without error, but the resulting PRG file crashes when invoking my assembler routine.
Is this normal, or what?

Thanks for your hints to nikob@mediascape.de

: Anyone know where I can get a good (free) assembler?

You could try to get hold of an early version of the Devpac assembly from
HiSoft -- it was given away on the ST Format cover disk once or twice
(although it isn't public domain, as far as I know).

Other than that, public domain assemblers are pretty lame. Get hold of
a copy of Devpac 3 from HiSoft -- it's _the_ best assembler, and isn't all
that expensive these days.

Different documentation uses different names for all the flags -- it might
not actually be called SHW_PARALLEL (I've never heard of that one).

Basically, with Pexec() there are a binch of mode codes which are single digit
which all have some meaning (create a basepage, load but don't run, just run,
load and run, etc...)

When you add 100 to those mode codes (some of them won't make any sense) it
means to do it concurrently, i.e., if you do a load go normally, your program
will suspend until the child had terminated. If you add the 100 to it, then
both the child and parent run at the same time (I think there's a library
function now called tfork() that does this, but that's in the MiNTlibs).

If you add 200 instead of 100, it means to overlay the child on the parent

thus killing off the parent and the child inheriting the parent process ID.

All this should be in the Atari Compendium under Pexec(). As for what Lattice C calls these flags, I have no idea -- I use either GCC or Assembly.

Don't flame me for not knowing any of the names of these flags by heart -- Pexec() isn't the widely used function in my line of work.

Cheers,

James Cox

I must disagree with that comment as my latest production is Falcon-specific and was written in a mixture of STOS and assembler. It features an extended resolution using the Falcon's hardware, 50KHz DSP module-player (with very little CPU time), uses the extended joystick ports and has no problem whatsoever with the Falcon's hardware.

> I like STOS a lot and used to write in it all the time (not just games)
> but it really doesn't work on a Falcon and so I haven't used it for
> about two years. I was disappointed about that.

Well, and you need to do is run a STOS-fixer on the interpreter (the .PRG file) and then you should be set! You can obtain some extensions that let you use some of the Falcon's extended hardware, or if you are keen, write some small assembler routines to use the hardware.

Also, if you write your own keyboard/joystick handler in assembler, compiled programs don't need to be fixed to run - they will work on any TOS version. I have done this and it works perfectly!

I am going to stick with STOS, even though I can write the programs in assembler. It is a very good environment for quickly developing programs and you can include assembler subroutines to speed up your code. It's "banks" are a feature that I have not seen in any other language and are much nicer than "malloc"-ing memory all over the place :)

Seeya,
Yiannis

Yep, well *almost* fullscreen - I didn't remove the left and right borders, only the top and bottom ones. :) The play area is 304*200 & scoreboard 304*40, with some other stuff on the right-hand side.

> >I plan to support the Falcon and STe as it is quite easy to adapt code
> >from Falcon to STe and vice-versa. Most stuff I write will require >1Mb
>
> What are you coding this in ?

A mixture of STOS and 68000 (assembler for all the AI, screen updates, joystick & keyboard handling and sound). The rest of it is written in STOS (basically holding everything together).

The memory requirement arises from the user of pre-calculated stuff to speed things up and ofcourse there's the extra ~80Kb for the extended screen. The compiled program is already 900Kb, so there's no chance of running it under 1Mb :(

The reason the code is really easy to adapt is that all the DMA sound system is almost identical between the STe and Falcon (apart from some registers like the volume, which is microwire in STe). So all the sound effects worked with no modification. The STe screen layout is the same as the Falcon's. I used 16 colour gfx to save on memory (the GFX are ~2Mb in 16 colours!!!)

Also, I've got no problems with the joysticks and keyboard as I don't use STOS's keyboard/joystick handler - I wrote my own. The jaguar joypads are also the same for Falcon & STe. The blitter code wouldn't need changing if I had used the blitter. :)

All up, I'm quite happy with how STOS is working on the Falcon now that I've written some basic routines to use it's features...

I'll finish off the STe version soon as I've finished the last part of my uni work for this year. It just needs volume control and some checking for playability (speedwise) in certain areas... news will be listed on my webpage for it...

Sorry to budge in... I am not sure what the problem is (was not following
thread from the start) but you can find the SHW_PARALLEL in the MagiX header
files. CH_EXIT is documented in the Compendium, look under event messages.

I am using all these in one of my program to start off parallel programs in
several OS including MagiX, MultiTOS & Geneva. As for MagiC, my beta testers
said that it works too. I cannot truely confirm MagiC as I do not own that OS.

Regards
William

Just the note that it's bad style to use v_show_c() and v_hide_c() in GEM
applications, because this (especially resetting via v_show_c()) conflicts
with the AES's own mouse hidden counter. Always use graf_mouse() to influence
the mouse pointer in GEM applications.

Ciao

>and that you had to create your own library.

Yes, but the STOS libraries (extensions - NOT the STOS commands) are suitable for use in games - some of them were originally written as personal libraries which then later got released.

>When you can create your own
>libraries it doesn't matter anymore wich language you choose to write the game
>framework in.

Hm... yea, this could well be true...

>Most mordern languages allow you to call external routines in a
>more or less easy way.

Yes. STOS does this.

>So it ends in a game where al the main game routines are assebly and only some
>disk routines and initialisation is done in the original language you started
>with. (I have done that once, converting every routine that used more than 1% of
>the total execution time to assembly.)

As long as your library routines are efficient enough, then there should be no need to convert most of the routines to assembler. Only if there is no library routine which does what I need have I turned to assembler... (which I put into a library routine, so that other people can use it if they need it...)

Nope, you cannot create local variables. However, you can easily create a stack, and handle it yourself. But why not convert the recursion into a while loop? (all recursive functions can be converted into this more spacially and computationally efficient form)

As I said - the lack of proper functions IS a limitation of STOS.

hm, i opened a vworkstation and compared the handle for the vdi
with the handle i got from graf_handle() for the aes ...
they are different - i would have expected that graf_handle
would give the same back as in the opnvwk() ... ?!

>the result might be far better than a regular care made of standard parts.

hmmm "might" ?, I say might NOT, I am willing to show that STOS BASIC
is the best for making games in 1996 between any other BASIC and even
C, That was the original question

> > Show me a top game made in C ? something thats better than one I can
> > show you in STOS?
>
>Civilization is done in C and Colonial conquest too. I don't know the amount of
>assembly that's used in those projects. It's quite easy to design your code in C

Neither do I, so surely that excludes them from the debate ?...next:)

> > Demos are hard to make, and about as usefull as a glass brick,

>They show you the limit of the computer in combination with a certain language
>and the imagination of the coders.

Yes they do don't they...and IMHO are STILL as usefull as a glass

> > Dont show me demos, show me a game made in BASIC that is better than
> > any I can show you made in STOS BASIC,
>
>I can't. Most games I know of are written is assembly (maybe C, you have to

Exactly my point.....

>step down to the Basic level to see anything like 'sorry for the worse gameplay,
>but it was written in basic;. ;-))

Now that is downright insulting..I suggest you look at something
thats recently been made in BASIC before you make such sweeping ill

informed statements, Sorry but making insulting remarks about BASIC
programs when you havent even checked any recent ones out cannot be
excused by a smiley,

> > Show me a game currently being made NOW in BASIC that beats any I can
> > show you currently being made in STOS,
>
>FUN ((ex)DBA) is working on a great game in Gfa Basic. I haven't tested it yet
>nor have I seen any STOS games lately (the last time I have tried a STOS game I

 Then how do you know its great and how do you come to the conclusion
that it is better than a STOS game ?

>had to switch TOS version, in that time (long, long ago) STOS crashed on TOS
>1.04.

 Here we go again, WHY does everyone have to base there opinions and
debates on STOS of old, STOS HAS BEEN UPGRADED! how many times does
this have to be said, TOS compatability is no longer a real problem,
or at least it need not be, I admit to having problems with making my
software run on a TT and certain Falcon configurations, but no more
than game makers using other programming launguages, certainly the old
TOS 206 problem no longer exists at all...as well as most other tos
vesrions,

>
> > BTW Yes Assembly is more powerfull (and less fun) but then again,
> > thats why I did NOT include it in the challenge ?
>
>So, there is the point I am trying to make. Writing games in assembly is very
>hard, but you can get the best results. In C it might be somewhat less

 You are making a point that has nothing to do with the original
question, I have already freely admitted that assembler is best, only
an idiot would try to say BASIC can beat assembler,

>difficult, but at the same time you can't reach the best assembly level. In STOS
>basic on the other hand, there are a lot of easy to use routines to do the hard
>grafix work for you (and to paly samples and so on) but at the same time you

 Jeeeeze....ther are no easy to use routines, the easy to use routines
produce "Slow", "Jerky" and "Unresponsive" (where have we heard that
lot before) games, the new commands are far from easy,

>lose the absolute command over your code. To reclaim the absolute command you
>have to write all the impartant routines yourself. When you get to that point

 I disagree, I make my routines do everything I want them to
do....have a look at some, then you will understand :)

>there is no significant difference between the various basic dialects and you
>are writing assembly code in basic (lots of pokes and memory moves, clockcycle
>counting and

eh?...

>preshifting of sprites). Maybe I am thing too much as democoder on this point.

I NEVER use anything but preshifted graphics, <?>

No you are thinking correctly, sorta :), are you saying that POKE,PEEK, LOKE, LEEK, etc are not BASIC commands, are you suggesting that when I VARPTR or maybe when I use BINARIES that these are not BASIC commands? memory moves and anything else you wanna mention are all valid BASIC programming,

>Bye, Hans Wessels
>

BTW Hans..do you have an STe? or FM? Can I send you one of my games in return for the Demo you wrote ? <SMILE>

Cheers.....!ynoT

Both run on the Falcon just fine, albeit a little fast. All you have to do (on some systems) is hold down an [alt] [control] combo (I'm not sure what order...) While on others, like mine it boots up fine with nothing having to be done at all. I've also heard of intermittent "crashing" on some Falcons...seems to vary a little from machine to machine. If you are using ICD's utils, read in the manual about how to force a floppy drive boot-up...(about the crashing-just save your game a lot! But then, like all good dungeoneers, I'm sure you do that anyways, right?!) :)

You should be able to download them from umich or toad. (I'm not
sure which ftp sites carry it. I only uploaded it to Genie and
Fidonet.) The names are ELF_HELP.ZIP and ELF_HLP2.ZIP (upgrade).

Or you can send the $20 shareware fee to E.L.F. Software, 9614
Oregano, Houston TX 77036 ($5 extra for non-USA personal checks),
and I'll send a registered copy via Snail mail.

BTW, I'm running out of DD floppies. Can you handle HD?

I think you are wrong here. On the desktop you can use the right mous button to select items in not selected windows. I regulary to doubleclick on an archive so it will be depacked in the slewted window. (I have installed al packer programs so a dubble click on an archive will depack the archive in the current (=selected) directory.

Yeah, or a SIMCITY (2000) clone. That would be just great! It would also run
under GEM so you can use it under a Multitasking system like MagiC in
16 colours and enhanced graphics in 256 colours (maybe even 2 if possible).
This would also make it compatible on all TOS computers, not only Falcon.

So what do you say? :-)

I have an Atari TT030 for sale.

Includes:
- 8 Mb internal memory (4 Mb ST-RAM / 4 Mb TT-RAM).
- 200 Mb SCSI harddisk.
- 1.44 Mb floppy disk drive.
- Crazy Dots II VME graphiccard (1024x768, 256 colors, 76Hz,
  800x600, 65536 colors ...)
  Works with every SVGA monitor.
- Installed Linux 68k (1.2.13pl10) with X11R6 (1024x768)
  I have connected my TT via a serial line to my PC and it works great
  as an X Terminal.
- About 200 diskettes with Atari software, lots of original software
  incl. handbooks.
- And more.

All in one sale.
Price: ATS 8000,- (DM 1150,- US$ 800,-),
       (bases for negotiation)

It also doesn't support shel_write() in mode 0, which means that you
cannot ask the OS to launch a program concurrently from within your own
program - except via the AV-Protocol but that relys on a having a decent
AV server installed - which MagXDesk aint!

It beats me why 2B go for this "almost there" solution of AES 3.99
rather than implementing it properly. When I first got MagiC 4,System
Solutions told me that they had passed a number of complaints onto 2B
about this but nothing changed for v5.

Regards
Martyn

Hello..

For a projekt I need to know the format of the Calamus textfiles.
As Calamus win95 cannot convert this files safely, I have to
do it myself.
Could anybody who knows the CTX fileformat send me this
information? I would appreciate any help.
The problem is I need to get the text out depending on the
layout, meaning I need to know how Calamus saves it.
If someone has documents or help files about it, please send
it. It can be in English, German or Dutch ;-) .

Thanks in advance,

Greetings, Erik

Yes, it does, thought to be honest with you, I never tested them with
anything but the basic test program that Atari sent to developers with the
AES 4.1 alpha.

Geneva completely supports all the flavors of shel_write(), including mode 0.

Hello,

I would like to have informations about Calamus Vectoriel file format (CVG files), because I need to save plots and would like to use this format for use them in calamus (GEM is done, but text are not recognized by Calamus, neither polymarks...).
Does anybody knows where I can get it?

Thanks,

Emmanuel

The best (And only) is Gnu C++, you can find it on most ftp-sites.
Perhaps the best site for MiNT and atari-specific Gnu-stuff is
ftp.fu-berlin.de.

Let's not get too depressed here. MagiC is very good, but "power users"

are IMHO better off with N.AES. It's fast and stable, and you also get
to use all the goodies with MiNT.

But for everybody else who probably just want to multitask GEM-programs
MagiC is still the best choice. It's easier to maintain and generally
requires less memory and CPU.

>      appl_exit();
>      Pterm( 0 );
>    }
```

No, this is one of the places where the Compendium got it wrong.
The correct way to do threads under MiNT is to create a new basepage,
then launch it with the Pexec "just go" mode (sorry, I can't remember
the numbers off hand). The MiNT library has a function, tfork(),
which will do all this for you. The code sequence above would then
look something like:

```
   pid = tfork(run_feature_X, 0);
```

where run_feature_X was defined like:

```
   void run_feature_X()
   {
      ap = appl_init();
      form_alert( 1, "[1][Feature X][ ok ]" );
      feature_X();
      appl_exit();
   }
```

The tfork() call launches a given function in a separate thread.
When the function returns, the thread is automatically terminated.
Note that the standard C library is *not* re-entrant, so the
thread must be very careful about the library calls it makes! (Indeed,
I'm not certain my example above will work; it probably depends on
how the library implements form_alert, appl_init, and so on).

Here's the "meow bomb" FAQ:

FROM: trebor@sirius.com
SUBJECT: INSTA-FAQ: For you to answer hate mail you might get about the binary flood
DATE: Sat, 02 Nov 1996 21:58:05 -0800 ORGANIZATION: Sirius Connections

MESSAGE-ID: <328833b1.6056085@news.sirius.com> NEWSGROUPS: news.admin.net-abuse.misc

Here's an short FAQ I've created, while trying to keep my mailbox from being destroyed by auto-responder acknowledgements.

INSTA-FAQ: What's with all this shit in my favorite newsgroup?
==========
I've created this INSTA-FAQ [tm, I guess] for those who have not yet learned to read Usenet headers, and who wonder WTF is up with this flooding. Please read it before taking any action about the flood.

What's going on?
==========
Easy! A gang of dysfunctional adolescents finds it hysterically funny to post a large file to a whole bunch of groups, putting the email address of a whole bunch of people in the Reply-To: line of the post. They hope to generate a lot of hate mail to those people.

They also include as many test newsgroups as they can in the flood. Since every post to a test newsgroup generates about a dozen acknowledgements from auto-responders around the world, they hope that this will create a mailbomb for the people in the Reply-To: line.

5,000 posts X 10 test newsgroups X 10 auto-responders = 500,000 responses!

Fortunately, and because they've tried this before, most people are prepared for this, and the mailbombs just don't materialize. Most people realize what's going on, and don't send hate mail to the innocent victims, either.

Who are these Idiots[tm]?
==========
In real life? I dunno... On the Net, they are just a bunch of little boys who haven't grown up, and who go around calling themselves 'The Meowers.'

If they don't engage in real vandalism, like spraying graffiti, or ganging up on elderly people sunning themselves in the park, it's because they're not brave enough.

They have all the guts of someone tossing eggs from a moving car.

What should we do?
==========
Right now? Nothing. Grin and bear it. Hey, at least you're not one of the people being mailbombed!

DO NOT SEND EMAIL TO THE PEOPLE IN THE REPLY-TO LINE!!!!

It's not them towards whom your anger should be directed.

If you want to do something, learn about Usenet and reading headers.

If you want to do something, oppose the Meowers and what they do. They have destroyed many, many newsgroups, and who knows when it will be your turn, or your favorite newsgroup's turn, to be harassed by them.

: AV server installed - which MagXDesk aint!

This is a lie.
MagiC's mode 0 is TOS-compatible what means that MutliTOS is not TOS-compatible.
To start programs concurrently there is another shel_write() mode which does not conflict with TOS.
One can ask which behaviour the system has by calling appl_getinfo(). This call tells you if the system is TOS compatible or MultiTOS compatible.

Another way to launch programs concurrently is Pexec(100). But if you think that you need AV to start a program you most probably never heard of Pexec.

: It beats me why 2B go for this "almost there" solution of AES 3.99
: rather than implementing it properly. When I first got MagiC 4,System
: Solutions told me that they had passed a number of complaints onto 2B
: about this but nothing changed for v5.

All shells use MagiC shel_write-Calls for starting programs. Changing this
would cause incompatibilities with former MagiC versions and with TOS.

Instead of complaining about version 3.99 tell us how to start programs
in MultiTOS using the single tasking mode.
There is none?
So use tool bars instead.

m > I am also interested about actual state of PureC. If 2.0 do
m > not come out, is it a matter of copyright ?

Sort of. Pure C was developed under license from Borland. Version
2.0 does not use any of the original Borland code, so ASH wants to
stop paying the license fee. The thing has been tied up in court
for years now.

 Destruction Imminent you can get from Goodmand Int, its a commercial
game, but is a very good Doom type of game, one of the best that will
work on an ATARI STFM Upwards..

 Killthing....Also STFM Upwards..but not released yet?

View the output of your program as row of data-packages, whereby
all packages have the same structure. For visualizing of this row
do this:

1) create a dialog with respect to the package-structure as
part of your rsc-file.
2) At the beginning of that program-run, which shall be presented,
call the whole dialog with objc_draw(...)
3) Whenever a new packages arives and shall be presented
in the dialog, initialize the parts of the rsc-part, which
therefore must get a new content. Refresh the output by calling
objc_draw(...) again, but in this time only for the dialog-part,
which has got a new content.

Very nice feature would be the dialog-presenting as content of
an own window. Connect window-management and prsenting of dialogs.

Note: In both cases you need a full GEM-environment with the
most important parts between appl_init(...) and appl_exit(...)!

If you want to display a dialog without stopping, just don't call
form_do(). objc_draw() will display everything EXCEPT the templated
TEDINFO objects. These can be drawn by calling objc_edit() twice
for each, ED_INIT and ED_END.

If you want to display stdout in a window, there are a number of
ways to accomplish that. The easiest is to use Geneva.

Use SHW_PARALLEL (mode 100). The "spawner" receives CH_EXIT when the
"child" terminates.

Erm, I'm certainly no GEM wizard,
but you could start by creating a RSC file containing a dialog box
which contains a TEXT or STRING object. You can then write your
own text into this object...
Which programmig language do you use? I can send you some sources...

If you've got enough disk space and memory (>=2Mb), then try
GCC (C and C++).
If you've got just 1Mb mem and/or not much disk space, then try
Sozobon C (no C++).
Links to FTP sites where you can get both packages are at my Page (see

I recently began programming a GEM application again,
I haven't done that since I quit programming in GFA Basic
and went on to learn C about two years ago...
It took me hours just to get a slider in a dialog to work,
as I have little GEM docs...
(I ended up using the GFA documentation on GEM :-)

Anyway, there's one thing I just can't figure out:

Even though I do a form_dial(FMD_START,...), mouse clicks seem to
be getting "shared" between my dialog (plain-old-non-modal type)
and a background application (for instance TOSWIN or the Desktop).
I use Sozobon C 2.00x (with XGEMFAST libs) and MultiTOS.
Anyone know what's wrong here?

    -=Levjenno

PS. I call form_dial() in the following manner:

```
int     x,y,w,h;
form_center(tree,&x,&y,&w,&h);
form_dial(0,x,y,w,h,x,y,w,h);

/* Dialog stuff (using form_do) */

form_dial(3,x,y,w,h,x,y,w,h);
```

I'm replying to this from work and therefore don't have access to the Atari Compendium but, from memory, shel_write() mode 0 was introduced with AES 4. Attempting to use it under single TOS will result in a crash. It doesn't crash under MagiC, it doesn't do anything else either though.
AES 4 was designed as multitasking AES. AFAIK, no existing commands were changed just new ones added. shel_write() mode 0 is specifically designed to get the OS to launch another application concurrently with the calling application. Concurrently means both programs may be accessed. It is specific to AES 4 and above since, as far as TOS is concerned, no version lower than 4 is capable of multitasking.
To state that because a command is not available in earlier versions of the OS it is incompatible is daft. Once the newer version is installed the command is available. It is up to the application programmer to ensure that the system their program is running on supports the newer command before using it.

> Another way to launch programs concurrently is Pexec(100). But if you think
> that you need AV to start a program you most probably never heard of Pexec.
>
Don't be ridiculous! Of course I've heard of Pexec. It is the command to launch programs as child processes of the calling application. Although similar, it does not do the same job as shel_write because the child program has control of the system until it is terminated whereupon control returns to the parent. This is true even under multitasking systems (including MagiC).
Of course I don't think you need AV to start programs. It is obvious that there is another way. However all the programming docs for MagiC are in German and one of my shortcomings is that I don't speak German.

>
This isn't the issue. Adding mode 0 support to MagiC would change
nothing. All programs that didn't use it would continue not to use it.
Programs that could use it (such as MultiPlicity and Thought!) would
benefit but nobody would lose.

> Instead of complaining about version 3.99 tell us how to start programs

No, Tony. He meant the LAST two - ie. STOS FAQ and STOS FTP site
(or at least thats how I read it)

Go to Tony's WWW pages, at:

http://www.airtime.co.uk/users/stosser

and you'll find both.

Anthony

Hi

I'm looking for a fast GIF-decoder. Is there anybody out there
which owns the source (C-source or even 68K-assembler) of a
fast GIF-decoder?
I'm also interested in the way to drive the Brainstorm JPEG-decoder
extension. Does anyone have some info about how to decode
a JPEG/JFIF-file using this auto-folder program?

Thanks in advance.

No, sorry, still not following this. Most of the shel_write() modes ARE
single-tasking since they were implemented prior to AES 4.

While form_dial() supposedly reserves space on the screen, the
window manager doesn't honor it. There are two solutions: call
wind_update(BEG_MCTRL) to turn off multitasking before calling
form_dial(), or put your dialogs into windows.

What Andreas means is that Magic doesn't have toolbar support,
but (he claims) that the other AES's that do support toolbars dont
have a shel_write() (or other method) that co-exists with
Single-tasking.

I'll leave you to fight over Pexec() as I've never bothered to
look into this call in much detail. :)

I think the form_dial call has to be wrapped between
wind_update (BEG_MCTRL) and wind_update (END_MCTRL) calls.
This will tell GEM that your dialog is taking over all mouse activity.

Will, it complain if it's not a stereo song or not? I'm not sure
what I have...

Anyway, it looks like it doesn't work on the Afterburner040. I get the
countdown (I guess it's the length of the song) and it counts
down, so it looks like it's doing something, but I get no sound.

Pvfork() is still blocking, and that cannot change. It is the Pfork()
that was made non-blocking.

Recently I downloaded the 2.6.3 version of gcc/g++
for MiNT. However, the linker was not included,
and the old linker searches for xxx.olb files
rather than libxxx.a.

It's obvious that I need another linker, but where
do I get it.

BTW: My old one is from about 1993.

No, MiNT does not support threads. Some people call it threads, but
in fact these are parallel processes. "Threads" always means _ONE_
process for more than one task. MagiC supports threads, MAGXDESK uses
threads.

Yes, it tells if the song is mono, but it's a little frustrating if you
have a slow connection and download large files which you can't play.

Anyhow, you would definitely notice that something was wrong if it would
play a mono song. :)

> Anyway, it looks like it doesn't work on the Afterburner040. I get the

This is a problem with the devconnects we use. Earlier we used the c bindings to do the devconnects. Then it didn't work in MiNT. Now, it's done by three assembler lines. (could in fact be made in two!)

Sometimes, this occurs but works if you press stop and the play again.

I'm not really sure why this happens, but the communication isn't really meant to be used the way we do and by some reason, the handshake communication from DMA to DSP doesn't work. By restarting the song, the DSP program is uploaded to the DSP again, and it might work.

Tomas

newsgroups: comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since the last revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platform such as Mathematica or Matlab.
My work is a complete package including the program and some

accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcomed ...
Have fun with my production, bye for now ...

Um, MiNT has supported threads for quite a while now -- at least the
tfork() library routine has been around since I got involved with it.
The problem is that the MiNT library itself isn't thread-safe, so two
threads could hit the same internal library data structure
simultaneously and screw each other up.

Ofcourse we will buy it if it's any good. Why not?
We realy need some _good_ games to get some life back in the games
market on the Atari. We have great graphics programs, wp's and other
cool stuff like CAB for the Atari, but we still lack some cool games.

Go for it!

BTW. $20 sounds cheap for Duke3D on the Falcon. ;-)

Hello. I am looking for a copy of PC Xformer 3.2 for DOS...does anyone know where I might be able to find one? I would also be interested in any 8-bit Atari emulators for DOS I might be able to FTP from the Net... I have an 800XL, and would like to program it using assembly. Is there a place on the Net, or does anyone know of a good book, which would teach me 6502 assembly? Kinda cool fact: the Apple IIe has a 6502, and SO DOES MY ATARI! :) I really would appreciate any help on these two topics. If you can help me, please e-mail me as I am not able to read usenet news. Thanx!

BTW - Do you know how to copy cartridges to disk? Thanx again!

I remember playing around with some way to run a function as a thread
by itself under MiNT while the rest of the program continued.
That was several years ago.

I think the MiNT call I used wasn't really documented at the time, but it
sure worked.
Looking through the include files, I can find tfork() which looks like what
I remember. It still doesn't seem to be documented, though.

>The problem is that the MiNT library itself isn't thread-safe, so two

>simultaneously and screw each other up.

I guess that might be a good reason not to document things. ;-)
Still, why hasn't anything been done about that yet? Surely it can't be

that difficult to make the library reentrant or use semaphore blocking?

Well, I'm not sure this is the problem, but I will give it a try.
Do you know if someone else have managed to ge it working on the
Afterburner040? The previous version (0.5?) did not.

This in under TOS 4.04 on a AB040 Falcon.

BTW. Is it supposed to work under MagiC?

Hello
     I own a falcon030 and lattacie C5.6, normally I run AES4.0 which came with multitos. However I have found that Geneva 4 supports most if not all the features of AES 4.1, i.e. iconify etc. Looking in the aes.h file from lattice C I have found that it to supports aes 4.1, the documentation (printed & on disk) makes no mention of these functions.

i.e.
messages : WM_ICONIFY, WM_UNICONIFY, WM_ALLICONIFY

etc.

I have got the iconify routines to work but haven't got a clue what all the parameters DO.... so far I just give them the window handle and hope.

I have written to Hi-Soft twice and both times all questions relating to these problems have been ignored while other parts of the letters have been answered. Thus any help would be very helpful.

Also does anyone know if the NVDI programmers guide has an english version anywhere?

Thank you

Dale Needham

The Atari Compendium is probably the best source for info about AES
versions up to 4.1 (as well as every other GEMDOS/BIOS/XBIOS/VDI call).
You can get it in book or CD form from Toad and probably other
distributors as well.

Geneva does support all of the AES 4.0-specific stuff, and most of the 4.1
things. You can use appl_getinfo() to find out if a particular call is
available.

That sound odd -- I would have thought that they would have tried to sell the
Atari Compendium to you -- it's about the best programming manual for the
Atari full stop, covering AES4.1 (and above...) as well as GEMDOS, VDI, MiNT,
BIOS and XBIOS stuff.

If you have a Falcon, then get Modern Atari Systems Software (also from
HiSoft) which covers Falcon specific stuff, as well as AES4 (not sure about
4.1, but prolly) and MiNT.

I'd like to know that too, anyone?

Cheers,

James Cox.

MAC-MiNT started as an attempt to get a GCC programming environment on the MAC.

Noew there are Virtual Memory versions available.

It should be possible to get up GCC on the MAC to compile Atari programs,
but since you have a falcon, why not use it instead.

Hmm, If it didn't work with that version, it's not very likely it will
work with the new version, 0.7.

The old, 0.5, used host transfer for data to the DSP.

It should, but I haven't tried. It works under oAESis and N.AES.

Erm, not sure but I saw a 200K doc entitled "NVDI" in a recent back issue (36 iirc) of ICATARI whilst browsing. I only looked at the first few lines before I lost it but it was in english and is probably what you are both looking for. :-)

As far as I know, there is no standard format for YM2149 music. There are plenty of music files by different authors. Mostly "Mad Max".

Trackers: Plenty of them.. Mostly 4Channel @ 10Khz for the STFM/STF/STM. On an STE+ stereo and up to 50Khz playback rate. Most handle "Amiga" Mod format.

Check PD libraries/Net sites for some.

Cheers,

Brian T. Innes

Can you tell me if Geneva supports AES 4.1 toolbars? (ie WF_TOOLBAR, WF_FTOOLBAR WF_NTOOLBAR wind_set/get and WM_TOOLBAR message)

It would appear that Magic 5 does not...

Cheers

Anthony

Actually, I think I have a BJ10 driver for GDOS. I have Speedo GDOS
though. I'm not sure if there's a difference in the actual drivers
or not.

: Hi folks! I'm in the process of setting up a shareware company
: called Atlantis Software Development. After perusing the computer
: market as it stands now, I've been convinced that the two markets that
: need attention are the Amiga and Atari markets. I've ruled out
: programming for the PC and Mac's because those markets are already
: crowded. What I am basically wondering is if there are still folks
: that would buy video games for Atari computers, like Duke3D stuff,
: and what they think is a fair price. I suggest a price of $20 for
: the registered versions of the games. Of course, the shareware
: "taster" is completely free. Within the next month I will be
: establishing
: a permanent Web page and Email address (right now I am using a student
: account). For the moment you can write me at bitbrker@ipa.net with
: suggestions and comments for the types of games you would like to see
: and which Atari platforms you would like to see it on. The initial
: Atari computer to be supported will be the Falcon, of source. But, I
: am willing to support any Atari platform that can handle 256 color
: displays and has at least a 68030 CPU. Let me know what you think!
: I hope that you will be pleased to know that I am here to serve you
: with great software for your Atari computer. I am not a fly-by-night
: programmer, nor am I interested only in making the most money that I
: can as a video game programmer. As long as there is demand for Atari
: software, I'll be here to make it for you. In the mean time, I'll be
: working on some games for the Falcon and Amiga systems.
:
:   Your friend,   Terry Miller 2, Atlantis Software Development

: P.S. Anyone who knows where I can get any interesting programming
:   documentation for the Atari computers, please let me know.
:   I am always anxious to add to my library! ;)

Duke 3d on Falcon? har, har! This project will probably never appear on
a screen! I don't like people who say such bullshit... Look at your company

I have an Atari STfm, 1Mb ram, mono screen which I now mainly
use as terminal for my linux box. Question: I am thinking about
programming again for my ST, for fun. But what kind of programs
would you like to see for this computer?

The Bad Mood graphics engine is available for anyone who wants to
put together a game of this type. Doom itself (the Id version) has
been ported to the falcon (I saw it running at the London Atari Show).
So these things are quite possible.

So stick it up your arse Mr Wolf. If folks want to work on things, and
and think they can do it, who are you to be so negative.

This is very amusing, coming from Hewlett-Packard Germany, who can't even get
their own gateway properly configured. And /you/ have the temerity to tell
/him/ that he can't do what he says he will? It is to laugh.

Hi, There are 2 little program I would like to have. And I was out of
luck to find one of them.
1 would be a small accessory that would play MID files. I know that
theres a lot of atari users who have a sound expander or at least a
synthesiser. The atari was/is the midi machine. And if CAB could use
it as a MID player it would be cool too..
2 would be a little auto program that emulates the controle key when
we press the right mouse button. Like this we could move files only
using the mouse. This would only be enable when we are on the desktop,
since some program use the right mouse button.
I think it's unfortunate that we can not use the right mouse button
on the desktop..
That was just some thoughts, thanks .. bye..

>So these things are quite possible.

 1) Being possible and actually happening are two very different
things,
 2) DOOM and Bad Mood (the latter is not a game at the moment) are
hardly comparable to Duke3d, not in your wildest dreams,
 3) I would agree, Duke3d Wont appear on an ATARI

    But the guy although making a valid point, seems to have put it in
a rather nasty way, Insulting in fact,

     But (again) I can see his point, someone pops along and says Hey!
everyone, I think I will make Duke3d for your ATARI, aren't I nice, or
words to that effect,well it sorta makes all the people who have been
trying for years to make a Doom clone look inept? and thats not very
nice,
     NO ONE has yet made a decent Doom clone for the ATARI Computer,
Substation was a brave attempt, DESTRUCTION IMMINENT is a great game
released at the ATARI show in Birmingham, better than Substation IMHO
and I am a beta tester for KILLTHING that IMHO kicks them all and will
work on anything from an FM,
      But none of them come anywhere near Doom or indeed the subject?
Duke3D

 The guy made a valid point, he just made it badly and insultingly in
OUR? opinion,

>So stick it up your arse Mr Wolf. If folks want to work on things, and

Ho dear...havn't you just done exactly what you are complaining he did?

>and think they can do it, who are you to be so negative.

Exactly, anyone want to give it a shot then go for it, if its a valid attempt then we will all support there efforts, I would be in Awe and indeed am at the efforts already made..if only I..nagh:)

Just my opinions :)

PS, Wheres the original poster now? working away on a Duke3D clone for the ATARI....I think not?

Cheers.....!ynoT

That distinction is really meaningless. The significant feature of threads

that makes them more useful than multiple processes is that they all share a single data space. In that respect, MiNT "threads" are genuine threads. The only notable difference is that instead of the added overhead of a threads-scheduler running on top of the Unix process scheduler, you only have a single MiNT process scheduler. As such, threads in MiNT can execute more efficiently than user or kernel threads in Unix.

As has already been pointed out, there's no problem with the kernel functionality, all that's missing is a library that supports a thread-oriented API. The source code for POSIX-compliant pthreads library is freely available; I believe that's where Linux's threads library came from. Anyone with some time could port to MiNT with minimal headaches.

I'd like to see a really cool virtual war game for the Falcon...
Something based on fairly current global situations...perhaps offering portable data so that current geography can be updated and changed.
Toss in as much as possible...politics...stratagy...spy networks...nuclear...conventional...weather...economy/production...
I guess you'd call it a "God Game"?

Also...I'd really like to see a statistic based Base Ball game...like Persue the penate. Better yet...a Rotissary version that'll work over the internet! Here...you might want to make versions for all platforms with platform independent data for exchange.

Graphics are cool...but I really miss game that are simply addictive and very playable! Smart, data intensive games would be a nice thing.

I'd like to see someone put together a nice set of tools for
making web-pages.

The main tool I'd like to see is a simple little program that will
load and display jpegs and gifs so you can rubberband various areas
of the image and create image maps...both client side and CIS script
formats.

Something else that would be really neat...
A program that can take Page Stream, Calamus, Post Script, Papyrus, etc...
documents and convert them to HTML. Next it should allow you to pick
text and images with your mouse and imbed your links.

According to what I read in the Compendium, I believe the correct way of implementing GEM threads is:

```
int main( int argc, char *argv{} )
{
  ap_id = appl_init();
  do_something();
  if( user_wants_feature_X )  {
    pid = Pfork();
    if( pid == 0 )  {
      ap = appl_init();
      form_alert( 1, "[1][Feature X][ ok ]" );
      feature_X();
      appl_exit();
      Pterm( 0 );
    }
  }
```

```
  clean_up();
  appl_exit();
  return code;
}
```

But this seems to fail. Both the parent and the child thread seem to be asleep.

Where is it wrong?

(I am using MiNT 1.14 on a 20 Mbyte TT (4+16) with about 12 megs of free ram (about 11 of them in fast ram) with AES 4.1. My compiler is Lattice C 5.60, and it is configured as 32-bit integers, near data, stack passing).

Are there any Atarians out there who have a copy of Pure C or Turbo C?

I'm asking as the Oasis coders (Dave Levi & Phil Yeadon) are looking to recompile mydials for GFA and Pure C or Turbo C is needed to recompile the code.

Can anyone out there assist.

Has anyone had trouble getting onto comp.sys.atari.st? Yesterday, the group suddenly disappeared from the 2 providers lists that I have access to. I can't even seem to get new messages via the Dejanews web newsreader.

Hello...

Could any people send me (if possible) the ENGLISH Help files of Pure C? I could appreciate any help.
Could any people send me (if possible too) any example on Pure C of Sprite use and/or OBJECT use? Need i libraries?

Thanks very much for any answer.

Greeting.

Nice idea, but unfortunately I am running a few Atari ST's here, so no
256 colors and no 68030 machines here....

Do you mind considering releases of 'bogged down' versions of your
games?

A nice book to have is the Atari ST Profibuch, it is in German,
but has a LOT of info on the internals of the ST/STE/TT and maybe
in later versions also of the Falcon.

Regards,
Ren Kint

Atari apparently did not have the time to design a completely new blitter
chip for the TT. The existing 8mhz one obviously would not work with the
32mhz TT. However, the Falcon does* have a blitter...

I know this is probably a very simple question, but I have recently got hold of a Canon BJ10sx printer, and want to use it to dump some images from GemView and so on.. I guess I need a GDOS printer driver for the BJ10 series.. does anyone have one or know where I can get one from please.. also it needs to work with GDOS release 1.1, as I'm not quite well off enough to get something nice like SPEEDO GDOS yet..

Thanks all in advance,

Neil

Yo,

Your code works but for the wrong reasons, take a look at this revised code with comments you should get the jist of what's happening:

```
to_printer:
    move.b      #14,$ffff8800.w     ; select port A register
    eor.l      #$20,$ffff8802.w    ; ensure _STROBE_ is low
test_online:
    btst.b      #0,$fffffa01.w
    bne         test_online

    move.b      #15,$ffff8800.w     ; select port B register
    move.b      d0,$ffff8802.w      ; put character on port B

    move.b      #14,$ffff8800.w     ; select port A register
    ori.l       #$20,$ffff8802.w    ; set _STROBE_ to high

    ; possible delay code maybe needed here on faster machines ;

    rts
```

On faster machines you may need to insert some code (NOPs will do) to stop the code from desetting the _STROBE_ signal too early! Although this will work fine on a standard 8Mhz machine.

Any questions then just ask.

Jr,

Sun Microsystems in their wisdom praised Java as THE ultimate runtime
language that would work on ALL platforms. They forgot to say originally
that they required a licensing agreement to be signed before you could
take away their source code to compile Java for your own platform. Sadly
this has scared all Atari coders away thus far...I could be wrong, but if
I'm wrong then whoever IS compiling Java for the Atari is being very
quiet about it!...:(

>
ok.

>     move.b      #14,$ffff8800.w     ; select port A register
>     ori.l       #$20,$ffff8802.w    ; set _STROBE_ to high
Wrong ----^
     move.b #14,$ffff8800.w
     move.b $ffff8800.w,d0
     bset #5,d0
     move.b d0,$ffff8802.w   ; set STROBE high

     nop            ; wait
; maybe more nop or here.

     bclr #5,d0
     move.b d0,$ffff8802     ; set STROBE low

; STROBE should be a pulse !

     rts

NOTE: During this routine set irq-mask to $7 to avoid access of any
other routine (like the disc-check in TOS) to the PSG.

I have a problem, hopefully one of you can help ?

I loaded an overlay via Pexec(3,...), then used it via direct calling,
thus no further use of Pexec(). How do I get rid of it later again ?

First thought is Mfree(basepage), but this is probably not the proper
way. What about environment, does it need to be freed separately ?

Cheers Peter

The real reason is that until very recently there was no way for Java applets to run on Ataris, because no OS supported real threads. It appears to me that recently released MagiC 5.0 could run Java applications, but there wasn't enough time for the coders to come up with something useful.

Cheers Peter

You've got the method exactly. Use Mfree() to free the environment, then
the basepage.

Hello ST-fools,

I'm looking for a girl, Carole Lepilleur. He had a letter on one of the Atari newsgroups. I discussed several sings with her, now I've sent a letter again, but haven't got any reponse yet. Now, I "fingered" her and got this reponse:

Account used on Tue Oct 1 10:08 (23 days ago)

It was long ago. Carole, if you're reading this, please write to me to "thehidden@ludens.elte.hu" or "sebi@augusta.inf.elte.hu"!

Thanks!

The Hidden

(P.s.> If someone of you know her, please tell her to contact me.)

Hello I use a falcon030 with 4M ram and a small hard disk. I have tried to install the rest of MiNT, i.e. that over and above what you get with multiTOS, most of what I have got works except the 'man' routine. This is driving me up the wall since the instructions on most of the other utilities I have got are in man format.

Whenever I tried to run man I get one of the following:

A report that Nroff cannot find it's macro file (solved by reinstalling the whole lot).
or when that works, typing [man xxx] where xxx is any man file I have produces the following.

pause while program loads.
message [formatting page please wait]
another pause
message [aborted, sorry...]

program returns to command shell.

It does this under MiNT (with or without GEM), and under normal TOS. It does not complain of missing files etc.

To start with it could not find files but now the Mint directory setup has it's own (virtual) drive via the alias command in mint.cnf.

The only part of mint I don't use is minix due to a small drive size and the fact that as yet mint is of little use due to this problem.

I am aware of one possible solution which is as follows:
can anyone post or email me (needhadp@sparcdii.derby.ac.uk) information on the man page format, e.g. what the embedded command sequences are and what they do so I can write a viewer that uses GEM and as such can be used outside Mint etc.

Having used man on unix I would like to be able to decipher the files I have got. I know you can read most of it but sorting the commands from the text is a pain.

Thanks to anyone who can help, or direct me to those who can...

Dale Needham

Does the 10sx emulate anything, Neil? You'll have to take a look in the manual but usually you don't need a specific driver for each printer model - just the one appropriate to its emulation mode.

I have a BJ300 which can either use Epson LQ850 or IBM Proprinter drivers.

Roger

I want to get make changes to the Atari NOS ka9q version, and possible to the PC one.

I really would like to make NOS able to connect with a ppp PAP server. I am now able to compile NOS 0.42 with Lattice, but I need some help.

I would add POP3 routines as in NOSPOP3, but I cannot find the author of that version, and correct the ppp-pap problem, so:

I am looking for sources, just to avoid rewriting the pop3 client that is working good in nospop3, for this and to correct pop3 or to add new features, I think it would be enough to get the most recent NOS sources for PC, I tryed to do this, but unsuccessfull. I found sources for TurboC in Qualcomm Phil Karn directory, but seems to be old stuff, anyway the attach command does not

recognize the ppp protocol (bug?). Mr. Karn says it is dropping this version going on with djpp or something similar, what is this ? I think I need the C version (or C++) to correct the Atari NOS.

My searches on the web give few interesting results about ka9q NOS, so please help me, I would also port to Atari any other PC stuff (written in C) that essentialy lets:

- connect in ppp pap to an NT server Backoffice internet provider
- email (SMTP - POP3)
- nntp
- ftp
- telnet (should be simple)
- scripts (automated sessions)

Please help me.

I ask you help to correct the NOS problem, at least tell me if any author can be reached by email, or any newsgroup or mailing list is available.

Here is where it fails to connect in ppp-pap, ack is received after pap, then a protocol is rejected, then a config option and then loop until disconnect:

: Does the 10sx emulate anything, Neil? You'll have to take a look in the
: manual but usually you don't need a specific driver for each printer model -
: just the one appropriate to its emulation mode.

: I have a BJ300 which can either use Epson LQ850 or IBM Proprinter drivers.

What Canon calls the BJ10 mode is actually IBM Proprinter mode (or at
least, that's the way it works on my BJ200). A BJ10 specific driver can
be font in the FontGDOS package:
ftp://ftp.uni-paderborn.de/pub/atari/tools/gdos/fontgdos.lzh
It appears that there are also archives of drivers for ink-jet printers
in the same directory.

Doesn't MiNT support threads? I never used this facility myself, but it all seems to be there.

Does anyone know of a way to view man pages on a falcon? I have tried
one or two manpagers but non of them worked, one crashed the other
displayed the message :

"Formatting Page, aborted sorry..."

Both were installed according to instructions to no avail.

Ideally I would like the specification for man pages, i.e. what are the
control characters & what do they do? So that I can write a simple pager
package [TOS or maybe GEM].

It would help if you could email this info to me due to a shaky
newsgroup setup in netscape 3 [problem this end]

There is a gem-based man-pager at ftp.fu-berlin.de called manview.

 >    bclr #5,d1
 >    move.b d1,$ffff8802.w    ; now STROBE is sure low
```

The .l should've been .w or .b but otherwise there is no reason to use your method.

```
 >> move.b      #14,$ffff8800.w     ; select port A register
 >> ori.l       #$20,$ffff8802.w    ; set _STROBE_ to high
 > Wrong ----^
 >  move.b #14,$ffff8800.w
 >  move.b $ffff8800.w,d0
 >  bset #5,d0
 >  move.b d0,$ffff8802.w    ; set STROBE high
```

Again no reason to type all this code.

```
 >  nop            ; wait
 > ; maybe more nop or here.
 >
 >  bclr #5,d0
 >  move.b d0,$ffff8802    ; set STROBE low
 >
 > ; STROBE should be a pulse !
```

That's just a matter of code ordering, it really makes no difference.

Jr,

Is there some "unique" AES window handling in the STe TOS (1.62)?
I'm getting reports of windows failing to open the second time on
STe's. I may be issuing wind_close() on a window that has not been
opened yet. Also any window situations reported to cause lockups?

I doesn't seem to happen on my Falcon.

Thanks in advance,
John

Yes, there is, in:
ftp://ftp.uni-kl.de/pub/atari/graphics/raytrace

I may have some directory wrong, but something like that anyway.
I'm not sure if this is compiled 68000 or 68030 though.

Okay, sounds great! How about a ftp site (and path) where we can
get these stereo mpeg songs!? :)

Talking about man-pages, isn't there a good shell like C-shell or T-schell
for MagiC?? I would love to have a _good_ one. The shit (if you can call
that a shell at all) you get with MagiC is only, that's right, shit.

THIS IS A REAL OPPORTUNITY TO MAKE MONEY GET RICH QUICK If you want a lot
of
money fast READ THIS!!! and it will change your life. I just read an
article in a newsgroup

describing how to make $ 50,000 in only one month from a $5.00 investment. Participation is all it
takes to make this work. PLEASE PRINT THIS ARTICLE FOR YOUR REFERENCE AND ACT NOW!!!

STEP 1:

Invest your $ 5.00 by writing your name and address on five separate pieces of paper along with the words, 'PLEASE ADD ME TO YOUR MAILING LIST".

You are paying for a legitimate service. FOLD a $1.00 bill or money order inside each paper (for safe
delivery cover the dollar bill in the paper), and mail it by standard mail to the following five
addresses:

- 1.Jason Segal, 5961 Glenhaven cres, Norfolk, Virginia 23508, USA
- 2.Rick Roehrich, 478 Conklintown Rd., Ringwood, NJ 07456, USA
- 3. Allen, P.O. Box 300, St. Peter, Minnesota 56082, USA
- 4.Chuck Rhoades, Rt 5 Box 172, Bowie, TX 76230, USA
- 5.D O'Kelly, 38 Brewery Rd, Blackrock, County Dublin, IRELAND

STEP 2:

Now remove the top name from the list, and move the other name up. This way, #5 becomes #4 and so on. Put YOUR NAME in as #5 on the list. You can use your real name or any other name but make sure your address is right. You can do this by simply retyping this article or re-posting it to other newsgroups with the edited address.

STEP 3:

Post the revised article to about 300 newsgroups. There are at least 17,000 newsgroups. Try posting to as many newsgroups you can. More posting means MORE CASH!!!

STEP 4:

Your are now IN BUSINESS FOR YOURSELF, and should start
seeing returns within 7 to 14 days. remember internet is new and HUGE. There is no way you can
lose. Out of every block of 300 posts, you will get at least 5 responses (this is very very
conservative estimate). Yes, thats right only $5.00.No checks but real CASH. Each additional
person who sent you $1.00 also makes 300 additional postings with your name as #4, 1500
additional postings!! WUH!! At least 50 people will send you $1.00 with your name as #4 (total
$50 based on a conservative estimate). Now those 50 new people will make 300 postings each
with your name as #3 or 15,000 postings. Average return, 500 people and $500. These 500
people make 300 postings with your name at #2, that mean 5,000 replies with $5,000. Finally
5,000 people make 300 postings each with your name as #1 and you get a return of $50,000
before your name drops off the list. NO RISK. As you see, the potential for earning is a lot of
money for only $5.00 investment. You MUST follow the rules. REMEMBER, millions of people

use NEWSGROUPS everyday throughout the world. SAVE this article or get a printout. GOOD
LUCK and enjoy your new found wealth. ACT NOW ! ACT NOW!

I have for sale an Atari TT030.

Includes:
- 8 Mb internal memory (4 Mb ST-RAM / 4 Mb TT-RAM).
- 212 MB Maxtor.
- 48 MB Seagate.
- TTM194 19" monitor (1280 x 960 x 2).
- SLM804 laserprinter (just installed new drum and toner).
- Spectre GCR Apple Macintosh emulator.
- Lighthouse tower case with 150 Watt PC power supply.
- Original case and powersuply available and usable without soldering !
- DD drive.
- Also have a HD drive available but needs Ajax controller.
- 8 x 1 Mb simms for TT-RAM upgrade (needs another TT-RAM board).
- Lots of dutch Atari related magazines and books.
- About 175 diskettes with Atari software.
- And more.

All in one sale,
Asking fl. 1700,- (+/- US$ 1000,-)

And of course, there's a man->ST-Guide convertor as part of the St-Guide
package. Never tried it, though ;)

Cheers,

Xav

Only one I can think of is if you put bad pointers for the NAME or
INFO text (or fail to define them before opening).

Don't have a path, but iuma also have ftp on ftp.iuma.com
The connection is still slow though. At least from Sweden, may be faster
from US.

Enjoy,

Tomas

 That was quick, i just got a nice letter from this guys postmaster
who says he has suspended his account until he gets in touch, when he
does, he will then get a warning and a lesson in usenet ettifingy:)

 It was a nice response and the original spammer is getting his arse
kicked,
 Do I feel like a snitch? no! I am sick of seeing these get rich quick
schemes and they are illegal, and certainly have no place in
comp.sys.atari.programmer

Cheers.....!ynoT

Quite right - atari programming has nothing to do with getting rich quick :-)

Christof Donat <cdonat@in.tu-clausthal.de> mumbled indistinctly:

>MiNT supports what all UNIX people call threads: the fork System call is
>there since freeMiNT1.12.6 I think.

Fork was always there wasn't it? I thought it was the non-blocking
vfork() that wasn't supported.

>generally Threads are a bit different. Treads use the same Memory Space
>(according to our Professor here who is lecturing about OS).

You can implement Threads by using Pexec (I forget the mode) to
execute a pre-loaded basepage and making it a copy of the current
basepage - this means that although it becomes a seperate process, it
shares the address space of the parent and executes in parallel.

Craig.

No no!
I guess you've got the program. If not, the latest can be found at:
ftp://ftp.nocrew.pp.se/pub/nocrew/tos/mp2_07.lzh

In fact, I recommend that you do download this file now, because I've fixed a bug from the previous. If you drag a .mp2 file to the mp2audio.prg, it will now start the program and play the song automatically.

The songs are not Atari or Falcon specific. They are Mpeg Audio Layer II format, a compression format. The normal extension to the songs are .mp2 and those can be found at iuma. Look in the directory /indexes at ftp.iuma.com. There you can search by artist, by title or other ways.

It's a little tricky to see directly if the song is stereo from ftp. You have to follow all symbolic links to the actual .mp2 file. Those files are named stereo-title.mp2 or mono-title.mp2. Be sure to only get stereo as this version only support those.

If you go through www, it's easier to see what's what.

Hope you find anything of interest.

Tomas

It basically pretents to supports threads, but does not in reality. If
you call Pfork then the forked process is running but the first one is
not, and does not resume before the forked process terminates.

Hi folks! I'm in the process of setting up a shareware company
called Atlantis Software Development. After perusing the computer
market as it stands now, I've been convinced that the two markets that
need attention are the Amiga and Atari markets. I've ruled out
programming for the PC and Mac's because those markets are already
crowded. What I am basically wondering is if there are still folks
that would buy video games for Atari computers, like Duke3D stuff,
and what they think is a fair price. I suggest a price of $20 for
the registered versions of the games. Of course, the shareware
"taster" is completely free. Within the next month I will be
establishing
a permanent Web page and Email address (right now I am using a student
account). For the moment you can write me at bitbrker@ipa.net with
suggestions and comments for the types of games you would like to see
and which Atari platforms you would like to see it on. The initial
Atari computer to be supported will be the Falcon, of source. But, I
am willing to support any Atari platform that can handle 256 color
displays and has at least a 68030 CPU. Let me know what you think!
I hope that you will be pleased to know that I am here to serve you
with great software for your Atari computer. I am not a fly-by-night
programmer, nor am I interested only in making the most money that I
can as a video game programmer. As long as there is demand for Atari
software, I'll be here to make it for you. In the mean time, I'll be
working on some games for the Falcon and Amiga systems.

Your friend, Terry Miller 2, Atlantis Software Development

P.S. Anyone who knows where I can get any interesting programming
documentation for the Atari computers, please let me know.
I am always anxious to add to my library! ;)

Someone will correct me if I'm wrong, but MiNT forks now work
properly, as of MiNT 1.12.6 and MiNT 1.14 (with VM). I am no
programmer, but maybe someone could look and see if thread
support is now sufficient for a Java port?

Yves

I can't find it documented ANYWHERE.

Have you tried playing with opcode 36? If it's anything it's likely to be
this one.

> perfect slave for the job. Forgive me if I'm wrong

First of all, what do you mean by shifting it around?

It is possible to use the DSP for image processing, but remember that the DSP hasn't got very much RAM memory to use, so large pictures, or even medium sized, can't be processed at once.
And, if only doing a filter or something like that, it would take too much time sending data to and from the DSP to really make it useful, at least in real time applications.

One good thing is that it is possible to use handshaked DMA transfer to and from the DSP, which makes it possible to use the DSP completely separated from the CPU, which will therefore be free to do other things. The transfer rate on DMA transfers though are slower than the regular host transfer, so it sort of depends on the application.

Of course, no matter the speed, it's more fun programming the DSP! :)

Tomas

It's a function of GEM/2, that never was ported for the ST.
This function is also included in MagiC, but not in any other ST OS.
Take a look at MT_AES, the multi-threaded-AES-library. This library
includes _ALL_ AES-calls.

Hi All

I have a couple of computers I am considering upgrading and I was hoping that somebody
out there in Atari Land could advise me as to what advantages I obtain through the upgrade,
or possible disadvantages, ie. new Bugs, incompatibilities etc.

The machines I am considering are:-

STFM 4Meg, current TOS 1.09, No Blitter.
STe 4Meg, current TOS 1.62, Blitter Fitted.

In addition can anyone recommend a good source for the upgrade chips.

Fortunately, many image processing operation work fine even if you can
only have a small part of the image available at once.

>And, if only doing a filter or something like that, it would take too much
>time sending data to and from the DSP to really make it useful, at least

Uhm, doing a standard convolution filter is _much_ faster with the DSP
than anything you could do via the normal 16 Mhz '030.

On a 640x480 greyscale picture, MGIF does a 3x3 convolution in 0.8 seconds
using the DSP and a 5x5 convolution 1.11 seconds. (640x480x16 colour mode)
For the 3x3 convolution that is 9 multiplications, 1 'divide' and limiting
to 0-255 for the result. 5x5 needs 25 multiplications.

Granted, other image processing programs using the DSP don't come anywhere
close to that speed, but that's not my fault. ;-)

>in real time applications.

Yes, real time image processing needs serious hardware.

>One good thing is that it is possible to use handshaked DMA transfer to

I've been planning to take a look at that. Could be useful for some things.

>Of course, no matter the speed, it's more fun programming the DSP! :)

That it certainly is!

The nice little card with an XC68040RC33 that's lying on a desk nearby
waiting to be installed will probably also be much fun, though. :-)

You can get the complete manual for the DSP56000 from Motorola's
WWW site (it's a pretty big download, but well worth the effort).

Craig.

To the original poster: If you want to use the Blitter, I suggest you get its manual from Graphics/blit.arc on atari.archive.umich.edu. Some relevant paragraphs from it are:

The HOG bit, when cleared, causes the processor and the blitter to
share the bus equally. In this mode each will get 64 bus cycles
while the other is halted. When set, the bit will cause the
processor to be halted until the transfer is complete. In either
case the BLiTTER will yield to other DMA devices. [...]

[...]

The BLiTTER is usually operated with the HOG flag cleared. In this
mode the BLiTTER and the ST's cpu share the bus equally, each
taking 64 bus cycles while the other is halted. This mode allows
interrupts to be fielded by the cpu while an extensive BitBlt is
being processed by the BLiTTER. There is a drawback in that
BitBlts in this shared mode may take twice as long as BitBlts
executed in hog mode. Ninety percent of hog mode performance is
achieved while retaining robust interrupt handling via a method of
prematurely restarting the BLiTTER. When control is returned to
the cpu by the BLiTTER, the cpu immediately resets the BUSY flag,
restarting the BLiTTER after just 7 bus cycles rather than after
the usual 64 cycles. Interrupts pending will be serviced before
the restart code regains control. If the BUSY flag is reset when
the Y_Count is zero, the flag will remain clear indicating BLiTTER
completion and the BLiTTER won't be restarted.

(Interrupt service routines may explicitly halt the BLiTTER during
execution time critical sections by clearing the BUSY flag. The
original BUSY flag state must be restored however, before
termination of the interrupt service routine.)

I thought I'd heard that the 68030-based Ataris didn't have a Blitter chip because the 030 could emulate it faster anyway? Or did that only apply to the 32MHz TT?

I have started writing about this on my homepage, at URL:
http://www.lysator.liu.se/~tobe/DSP/DSP-main.html

I haven't written more than what I have there, and right now my studying takes too much of the time I have. Ok, so I'm a little lazy too, I admit! More will come in the future, but the things so far are mostly introduction to the DSP, how it uses fixpoint numbers, it's registers and stuff like that. Nothing Atari specific is written yet, but I'm sure this can be found somewhere else.

I will gladly help anyone who wants to start program the DSP.

Tomas

We have done this already and have working routines for handshaked DMA transfers both to and from the DSP. It's good if you have data that the CPU are drawing on the screen that the DSP has calculated. Then you can have two buffers, one the CPU is using and one the DSP uses, and flip between these.

In one of our latest projects, the Mpeg-2 audio player for Falcon, we also use handshaked DMA transfer to the DSP and nonhandshaked (frequent) transfer from the DSP to the DAC.

I'm currently working on an GEM interface for it. A VERY beta version of it can be found at
ftp://kaneda.hemmet.s-hem.chalmers.se/pub/nocrew/tos/mp2audio.tar.gz

Sorry about the .tar.gz even if it's TOS only, but there are depackers for these.

This version only works with an external 44.1Khz clock, unfortunately. The finished version will have support for internal clock.

I tried it. The function removes the entry but still leaves a blank
slot so is pointless implementing just before program termination.
Such is life. (MagiC 2).

I am actually using NOS to connect to my provider, the problem is: it does
not work ! It works on a friend's SLIP account but sleeps on ppp+PAP

authentication with my provider, running NT server+backoffice, accepting
ppp+PAP immediately after modem connection.

I talked with David Nash, but trying "status up" in dialer or "ifconfig
<iface> up" after connection to start ppp negotiation doesn't help, the line
falls suddenly. I would even correct NOS sources, but I should work on NOS
POP3 version not rebuilding also this stuff, so please, can anybody help me
(at least to find those sources) ?

Hmm... have you ever thought about doing am mpeg-2 encoder as well using the DSP,
or isn't it possible? Now there isn't any encoders for the falcon so the
mpeg-2 player is rather useless, atleast for me. :-\

Nice. What will the GEM interface do? AS it's just a player it can't do much,
but it's nice anyway. :-)

summary: Problems compiling MiNT using gcc 2.6.1

Hello,

Last week, I grabbed MiNT 1.14 of the web and tried to compile it
using my gcc 2.6.1 on my Mega STe4 running MiNT 1.12-Beta.
Compiling went ok, but somehow the preprocessor cannot handle the
'\' in a c-source to indicate that a *program* line continues after the
ascii 'end-of-line'.

Is this a 'dos/unix' problem concerning cr/lf? What is going wrong?
And, of equal importance, how to fix it?

Many thanx in advance!

Greetings

Florentijn van Kampen

From: gigxr01@nt.com (Gerry O'Rourke)
Subject: I need a Minix aware version of 'find' for MiNT
Date: 1996/10/14
Message-ID: <gigxr01-1410961430450001@47.85.0.99>#1/1
X-Deja-AN: 189320323
organization: Northern Telecom (Ireland) Ltd
newsgroups: comp.sys.atari.programmer,comp.sys.atari,st

Can anybody reccommend a version of 'find' which works with Minix partitions?

I am using the version from Knarf's German MiNT Distribution, GNU Find
version 4.1 (I think). When I use 'find' on a TOS partition, it works as
expected.

When I use 'find' on a Minix partition (30 character file names), it quits
immediately with an error' memory exhausted'.

Also, can anybody tell me the correct way to pass arguments to find's
'-exec' option. On another version of find, I had success with the following:-

find . -name *.ZIP -exec "ZIP -xrg {}".

When I try this with GNU find, it complains about no parameters for -exec.

I have read the 'find' MAN file, but can't make sense if it.

Help!
        I am trying to update Telnet with Lattice C, using uncompleted source from Dan Ackerman. I can run the program under lattice C in debug mode just fine, but from the desktop it just gives me two bombs, and crashes the computer. Totally. It doesn't even reboot right without a complete reset.
        Does anyone have any experience with debug who can give me some help???

The Lattice sources for Nos 0.42 can be found FTP'd from
ftp.demon.co.uk. Look in pub/atari and you should find them fairly
easily. I have not found the sources for POP3 Nos myself either, so if
you do find them let me know!

Having said that, Nos 0.42 does contain POP source modules. I do not
know why they are unimplemented!

It's not me who has done the DSP code for this, it's Fredrik Noring.
See: http://www.lysator.liu.se/~noring

But there is a possibility there will be an encoder too. Not in the near
future though.

Mpeg-2 song can be found on http://www.iuma.com
It's slow, but some small songs can be fetched from there.

Well, it's just a shell for play, stop, load, pause. A future feature will
be to have lyrics to the songs syncronized with the playing song.

That's great! Even a CPU based one would do. Okey it will be very very slow,
but it's still better than nothing until a DSP based encoder gets released.

> Mpeg-2 song can be found on http://www.iuma.com
> It's slow, but some small songs can be fetched from there.

Well, as the internet connection from Ericsson already is ssslooowwww I guess
I will get nothing from this one.

They are only POP2, I think we should be able to find POP3 in the pc version,
as the nospop3 author did, in fact.

Rather than re-invent the wheel (again), I am interested in locating source code to talk to the serial ports and any modems connected thereto, and can handle XYZmodem protocols.

Ideally it would be TSR-able at system start-up, and callable from the currently running app (or apps), although that last part is less necessary.

Well I'm certainly no expert on programming, but assuming you mean that it runs fine from MonST under Lattice, then this _might_ be relevant.

A while ago I had a similar problem with code to read the joystick ports. Worked fine in MonST, but not from the desktop. It turned out that it was a simple case of the hardware needing time to initialise properly - single stepping in MonST was giving it that time, but from the desktop it was too fast. A simple for loop as a delay solved the problem.

Obviously this is unlikely to be exactly the same problem you're having, but try looking for places where the machine needs some time to initialise something.

Cheers,

Xav

The arguments don't usually have to be quoted, but there should be a
quoted or escaped semicolon (\;) to end the -exec arguments.

-I am trying to brake into the world of Atari progrmaing under MagiCMac, does anyone have some source code to a simple application of any kind which works under MagiCMac and can be complied under GFAtt (I have yet to find a place to buy this!). I know this is a lot to ask but I think it is one of the best ways to learn. I have a MagiCMac web page and would like to post some example code of my own it.

Please email if you can,
Zan

So what do you think is best: DEVPAC and using assembley or C ? Which C is really good? Lattice C? or Something else ? Isn't there a simple 68030 compiler that will take assembley Language text files and turn them into PRG's ? Where do I get info on GEM and programming graphics, the blitter, I/O to SCSI or IDE or just "The SYSTEM", ho about serial and parallel port programming and god forbid the LAN port? Where do I get this information and a good Assembley compiler ? Which ones do you recommend ? There are some really comprehensive Assembley packages on the MAC in shareware land, anything like that for the Falcon? Thank-You!

Paul

I am interested in finding all possible details on the intenal IC's of the st, especially the MMU, and all atari custom chips. I would also like info on addressing the disk controller chip for floppy access, as I would like to write a bios/xbios replacement. If anybody can help me please reply to my address directly.

Chris.

This is general because I dont know anything about GFA ...

>-I am trying to brake into the world of Atari progrmaing under MagiCMac,

Any legally written Gem program will run under MagiC and thus should do so under MagiCMac. The same applies for most of TOS. MagiC docs can be found on some german sites and are only in german unfortunately. Just a few days ago someone (name escapes me) said they were seriously thinking of translating them to english.

>does anyone have some source code to a simple application of any kind

>which works under MagiCMac and can be complied under GFAtt (I have yet

Start by getting some standard Gem docs. Experiment with AES calls and
a resource editor - this is the highest level and will give you some
understanding of OBJECTs. Try controlling a menubar - this will
introduce you to simple messages. Then try dialog boxes to understand
OBJECT's fully. Next try putting the dialog into a window - you wont
be able to do anything with the dialog itself but you will learn the
fundamentals of window messages and control. Check it works in
different resolutions. Now do the same thing in a window using the VDI
to draw text or graphics.

There's a couple of libraries for GFA which will take much of the pain
away I believe.

You need to get the Atari service manuals for a real understanding of what
goes on inside the ST.

The service manual gives a good grounding in how everything fits together
inside the ST. It does not contain detailed information on the custom
chips; for information on the others, try the manufacturer's websites, or
get a copy of the data sheets.

For more information, get a copy of the Tech manual, (should be on umich)
which will give internal block diagrams of the video system.

Any help about this is helpful, I will soon have a look at last PC sources, to see if I can update something.

(I write predominantly for the TT and ST-series using Lattice C 5.60 and Devpac 3.1, but my code will also run on Falcons - I have yet to receive a "it crashed on the Falcon" error report [oops, I've just unleashed a few thousand demons, who'll guarrantee I'll get heaps of bug reports from Falcon owners in the next 24 hours])

Lattice 5.60 is quite good, but, depending on what you want to write, it may be worth your while looking at different languages.

ie DSP native code can only be generated by an assembler (like Devpac DSP), LAttice C will not generate anything but 68k code (68000-68040 and 68331/2) and FPU code (68881/2). Code for the 68851 MMU has to be written in assembly and linked in. (Obvious, I know, but I just thought I'd pre-empt a few nitpicks)

> Isn't there a
> simple 68030 compiler that will take assembley Language text files and
> turn them into PRG's ?

For intricate programming within a predominantly Lattice C app, the included assembler is satisfactory. However, if your assembly code is very intricate or makes use of deeply nested macros (or recursive macros), the lattice C assembler will barf. Therefore, I use Devpac 3.1 on those tasks (it will generate a Lattice object module that can be linked to a Lattice app).

> Where do I get info on GEM and programming

GEM info is found in the (ARRGH! NOT SPIRAL BOUND!!) Lattice 5.60 manuals (If you can get a copy of the 5.x manuals, they _were_ spiral bound and will lie flat - or at least the ones I got with 5.06.02 were in 1991)

The Atari Compendium book is quite good on hardware level info, (register addresses, and bit layouts for some of those registers, but not _how_ to program them) but sometimes you feel that you need more. Usenet is a good second info source!

POP3 is mindbogglingly easy to implement - I've got a dead short C
program (<100 lines) that does a POP3 mail fetch using MiNTnet.

Text only, so re-working for NOS (though why folks want to is beyond
me) should be real easy.

Craig.

in Germany there is PROFI BUCH, and there is also English relase of thiz
book, and if I remember right it's called: ATARI COMPEDIUM
if hardware infos are needed, then also look out for HARDWARE v7.0 it's
a text document... should be available on SUNSITE.CNAM.FR /pub/Atari/...
under Docs (or something like that) directory... or maybe on FTP.UNI-KL.DE
/pub/atari/... (maybe "texts" directory)...

> Where do I get this information and a good Assembley compiler ?
> Which ones do you recommend ?
>
I think that DEVPAC v3.10 assembler (maybe there's later version) is the
best for Atari Falcon! [Devpac is a HiSoft product]
to contatc HiSoft: http://www.hisoft.co.uk/products/atari/

> There are some really comprehensive Assembley packages on the MAC in
> shareware land, anything like that for the Falcon? Thank-You!
>
really don't know if there're any shareware assemblers for Atari Falcon...
For Atari ST there was Turbo Assembler, but dunno if it was ported to
Falcon... BTW... for sure one of the best shareware DSP assemblers for
Falcon is QUICK-DSP Assembler by Audoly Gilles [FRANCE], available on
FTP://SUNSITE.CNAM.FR/pub/Atari/Falcon/Programming/...

On the telnet front it consists (for me from within Nos) of simply

telnet pop.dial.pipex.com 110

The pipex server then tersely introduces itself and sits there doing
absolutely nothing which gives the distinct impression it is a machine
not human interface.

USER maci38

causes it to report "OK <code> valid mailbox".
```

PASS password

causes it to report "OK <code> User mailbox locked and ready".

At this point I can type other commands such as STAT which tells me how many emails I've got sat there. I'm afraid I've forgotten the command to display an email (SHOW <email_num> perhaps?) (I only use it to see if I should run AntMail). I do remember "DELE <email_number>" (as shown by STAT) does remove emails.

QUIT

gets you out.

Not having read the relevent RFC's I've no idea if this method of access if generally supported or not but as it returns RFC type error codes along similar lines to Nos's NNTP and SMTP it could be worth investigating further. ;-)

What sequence of Bconin and Bconout calls must one make to implement the X/Y/ZMODEM protocol?

Where might one find a reference to such protocols?

It's to run on a multi-serial port Atari (MSTE/TT/Falcon).

Hi Alexander,

If you are looking at GFA Basic, you can get a copy from Systems For Tomorrow,
sft@sound.net

Also, ask him about Face Value, it is like Visual Basic, object oriented
programming and is designed to be used in conjunction with =
GFA. You still need GFA to put everything together.

All the best,
Chris @ Computer Direct

: quickly (only 5 megs available space, I'm sorry to say).

I took a quick look, though I'll have to take more time to look through it
some more. Seems you've been putting quite a bit of work in it since I was
last on it! Keep it up!

However, I'm more interested in finding the FidoDoor program than the
other stuff, since I think there's been some updates since. If I have to,
I'll make a long distance call to the guy's board, unless someone lives
near him and it's a local call for this person.

: I use Semper, so I really don't know about that. Bill Scull is the current
: developer of BTST - best to ask him in AtariNet.

I unfortunately have no Fido or Atari net access at the moment, as the
accesses I've had were over local boards. At least most of them want a
subscription rate to get that access. None of them have AtariNet access,
as far as I know. Does he have Internet access? I think I may have noticed
his name somewhere around on the net. Now that I think about it, I may
have noticed some sort of program to help out in the BTST setup in one of
my many Atari CD ROMs... Gotta look...

Well, it sounds like the DDD accelerator allright :-)

> Two of the boxes definetely have cristals in them (one supplies 40Mhz to the
> 68030 and one supplies 50Mhz to the dsp)

OK.

> The owner, which I definetely *DO* trust btw, told me he hadn't the
> experience to do it.

Well, you'll have to find somebody who has experience with soldering and
you need a good fine soldering iron, which doesn't get too hot.

> Now I have some problems:
> -I don't know if this accellerator thingy works with the falconspeed.

FalconSpeed can work with up to 36 Mhz CPU and 18 Mhz BUS, and as far as
I remember the DDD accelerator has a 36/18 Mhz setting too.
40/20 Mhz mode is a bit uncertain though. And it is not guaranteed that
your Falcon will work properly with 40/20 Mhz mode, not because of the
heat, but because the DMA sometimes gets very upset with a 20 Mhz
system BUS, it won't smoke or anything like that, it just doesn't work
properly. This can be fixed though with some hardware patches.

If you can't get your Falcon to run with 40/20 Mhz, you should consider
buying the brand new accelerator from TITAN DESIGNS called NEMESIS.
It has a special hardware patch, which makes 97% of all Falcon's run
correctly with the DMA-chip up to 24 Mhz BUS!
The CPU isn't double clocked though, hence the system runs with
24 Mhz CPU and 24 Mhz BUS. But this setting gives a very good
performance raise anyway, since the BUS is a lot faster.
You can also run at 640x480 in TrueColor non-interlaced in SVGA-mode
with a 24 Mhz BUS! Maybe even a bit higher...

> -I don't know if I can still install a coprocessor.

That shouldn't be any problem, as far as I know.

> -If a copro can be installed, I don't know which one (what clock speed)

Well, if the DDD-accellerator has FPU acceleration too, say up to 40 Mhz, you must buy an FPU rated at 33 Mhz (MC68882-33), these can also cope with 40 Mhz clock-speed. I have mine running at both 36 Mhz and 40 Mhz, without problems, and it's a 68882-33 chip.

If you can't get a 33 Mhz FPU, just avoid connecting the acceleration wires to the FPU and it will only run at BUS-speed, that is either 16, 18 or 20 Mhz clock, depending on the accelerator setting.

You should however be able to find information on this in the DDD-accelerator manual.

> -I don't know what I have to do to make sure that my Falcon doesn't spit
> smoke after running with the accellerator gizmo.

If you install the accelerator properly (as the installation guide tells you), without doing anything odd, there
shouldn't be any problems at all. My Falcon has been running at 36 Mhz CPU, 36 Mhz FPU, 50 Mhz DSP for 2 years now without smoking :-)

> Oh phuuuleez someone help meee,

My accelerator is a FX-Card, which is an accelerator card that can run at 32/16 Mhz, 36/18 Mhz (mostly used) and 40/20 Mhz (DMA-problems may appear)
and gives the DSP 50 Mhz clock and the FPU the same clock as the CPU. In addition to that, it can accept up to 10 MB FastRAM (FX-RAM) with 30-pin SIMM's, an additional 72-pin module can be connected to the FX-Card if one prefers 72-pin SIMM modules instead of 30-pin's.

And as I said earlier, my machine doesn't smoke or anything :-)

> Herman

I hope these words can help you :-)

Keep Cool and Flying...

ChainXOR...

Taking 5 minutes to read what follows can change your life :

I saw an article in an internet newsgroup telling me I could make $50,000 within a month for an investment of only $5.

I thought it was a huge joke. I spoke to my wife, attorney and friends about it, and they all agreed it was some kind of scam. I can't stand scams, because usually someone gets burned, and I didn't want it to be me. Of course, I rejected the idea at first. after a short period of about two weeks ,I thought : "I have already heard of such things. But on the Internet ?!?!? ". I decided that even if I had to throw $5 into the fire, I wouldn't mind it that much, and gave it a try .After all I needed a LOT more than five dollars.

Two weeks later, I began receiving money -- every day! I could not believe it! Soon, hundreds, and then thousands of dollars began to roll in. Within 4 weeks, I had received a total of $32,445! It came from everywhere in the world. My bank account has changed its "-" into a big "+" (++++)!!!,I bought myself a car and things I wanted for a long long time for my wife and kids!

If you follow the three steps below, there is no reason why

the same shouldn't happen to you! This is a legitimate investment opportunity. You invest $5, and you receive a return on your investment. So does the next investor. NOT ILLEGAL, NOT A CHAIN LETTER- PERFECTLY LEGITIMATE.

If you are not interested, then don't participate, but please print this article and pass it on to someone who may be interested, so they can take advantage.

The procedure is simple: 1) Write your name and address, an e-mail address, and the name of the newsgroup where you learned of this on 5 sheets of paper. Below that, write the words, "Please add me to your list." Fold $1 note or bank draft or money order in each piece of paper and send them to the following 5 addresses.:

1. Oleg Gorbik,
   10834-97 St.
   Edmonton, AB, T5H 2M3 CANADA

2. Nir Levi,
   PO BOX 342
   Yavne, ISRAEL

3. Landon
   #1 Lakeway Drive
   Conroe, Tx 77304 USA

4. Olivier Arcadipane
   237 rue Francois Andre
   7390 Quaregnon BELGIUM

5. Beyond Technology
   5641 Apgar Street
   Houston, Texas 77032 USA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. Use a simple text editor such as Notepad, in your "accessories" window (If you have MS-Windows),or DOS editor. In fact, any editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000, so it shouldn't be hard to find that many. Try posting to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message!

You are now in the an order services business, and should start seeing returns within a week or two. Of course, the

more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself "The Manager", "The Boss", whatever but make sure your address is correct.

Now, here is why the system works:

-Of every 200 posts I made, I received 5 responses. Yes, only 5. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. ie. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people = $500. They make 200 postings each with your name at #2=100,000 postings=5000 return at $1 each=$5000.

-Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THATS IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS! Total income in one cycle=$55,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. the more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $5. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money? "Big Deal, so you lose $5-but what are the chances of that happening ?? Do you Realize that NOBODY cares for the LEGAL chance of winning such a BIG money as 50,000.00 $$$$???? and all for a microscopic investment of five separate dollars? just think of all of the new Internet users that join the net every day!!!

There are millions of internet users, and millions of new net surfers every month !!! This is the great plus of the Internet, people all over the world can hear you and listen carefully if you talk reasonably. Everyone will take that chance ! I agree, If it wasn't the Internet, and was a small circle of people, the chance wouldn't have been so small. the amount of money had to be 200 times bigger, and the chances were zero. It wouldn't succeed.

But here, on the Internet, it is a giant village, where new thousands of members join in every day ! you CAN'T lose !!!!

Remember- read the instructions carefully, and play fairly. That's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES,NOT PLAYING THE GAME FAIRLY IS ILLEGAL.SO LET'S BE REASONABLE AND PLAY FAIRLY,SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK FOR YOU ALL, And remember, play fair and you'll win, I don't want to mention what might happen to those who won't. AND AGAIN,SEE YOU NEXT TIME WITH SOMETHING YOU WANTED FOR A LONG TIME !!!

Hi!

I'm wondering if there is a program somewhere that is able to convert an
RSC file to C code?
It has to be able to convert CICON objects too.

Thanks,

Tomas

OK, so I grabbed the MintLibs for SozobonX, thinking I could you my
nicely running Mint system for my Operating Systems programming
assignment. Much to my dismay, however, it appears that fork() is not
implemented, or at least, that's what it looks like from the unistd.h
file. Is there a later verison of the libraries where fork() does work (I
have v44 (?)). Will I have to install Gnu C if I wish to take advantage
of Mint's features? Or even install Linux or NetBSD in order to gain a
semblance of a fully functional UNIX programming environment?

Hello Atarilovers,

Perhaps you haven't read any letters like this for years, and Atari ST is now out of fashion. So, I'm speaking to that few people who are mad of this kickass computer. I would like to trade with ATARI ST games (I have about 200 of them...) via internet, e-mail, snail-mail or what. I'm also interested in STe and Falcon 030 games. Please let me know if you're interested. My e-mail address is thehidden@ludens.elte.hu (Yeah, you're right, I'm hungarian!!!), but if you reply to the actual atari newsgroup, that's all right too.

If you reply, I send you my list. And one important thing: I'd like to do this without sending money or asking for some bucks...

Cheers,

The Hidden (aka Sebi)

(P.s.> Mark Love, if you read this message, please contact meeeeeeeee!!!)

Yes !

an old but good program may do this very well, it is "WERKS", which was
produced by HISOFT. It is copyrighted and can be found also in the Lattice
C package.
Good Luck.

If it's a text file, I don't know.
But .sea is the extension of self extracting files packed with a program
on the Macintosh called StuffIt. As far as I know, it's only the Mac that
uses this format.

If this is an inappropriate newsgroup for this type of posting, please accept my apologies.

Pelican Consultants International Ltd are a search and selection agency who specialise in interactive entertainment - both hardware and software.

Many of our clients have asked us to keep a constant stream of candidates coming through to them as they continue to expand.

Throughout the whole of the UK, we have a need for programming talent. If not already experienced in the games industry, you will at least have a keen interest and will have suitable qualifications highlighting your abilities.

We are particularly interested in people with programming skills in 3D graphics, artificial intelligence and networking, but we are not merely limiting ourselves to that.

If you are working in the industry and looking for a move, or if you would like to enter an exciting and constantly changing marketplace, we can put you in touch with the right people.

All applications are treatest with the upmost discretion and we will spend a lot of time finding out about the job that you want to do, rather than just sending your details to anyone we can think of.

For an initial discussion, please send your details to me, Paul Rose, via private email or call me on 0181 423 3400.

We look forward to hearing from you soon.

If you want to convert the resource file entirely into C source code so
that you can compile it into the executable and ship a program that has
_no_ .rsc file then yes there is at least one program that does this.
But I can't remember what it was called! It was Australian and the
particular release I used had a couple of small bugs so that you had to
make a few edits in the output. But it worked. I converted a complete
resource with menus, icons, buttons etc into C source and built it into
the program instead of using an external resource file and rsrc_load
with little trouble. Of course the executable gets bigger by about the
size of the resource file. And it means no-one can edit the resources to
change the language (for example). This might be what you want!

If it's for the ST, try copying it to *.TOS and running it. An ST
self-extracting arhive will work, and if it's not an ST SEA, it will give a TOS
ERROR 35 or something similar.

I seem to recall that DC created an SEA depacker some years ago, anyone else
remember that?

Hi,

I need very very QUICK help for an Ethernet card called RIBEL C90.
=====
There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

I recall trying to get STSPEECH routines to work with GFA 3.07, and never having any luck. (I think I'd pulled them from a GFA 2.0 program.)

Somewhere on disk I think I have Modula-2 and/or assembly code for interfacing with STSPEECH. I'll see if I can find it; you may be able to adapt it to work with GFA 3.5.

says:

>Thanks for the info.
>I looked into it and it really seems to be an archive.
>Is there really no depacker for the ST ?? ;-(((
>
NO!!!! It IS an archive, but for the MAC (or Spectre) ONLY!! It is a
Self Extracting Archive for the MAC, like a .tos self extracting archive using
zip2tos but runs ONLY in a MAC, and the files it contains are ONLY for a MAC!!!
You can unpack it in a mac, but it will do you NO GOOD on an Atari.

Ther is always a distribution problem with alt.binaries groups, and c.b.a has not existed for months. The moderator pulled an end run and pushed an RFD through to get it removed early this year. I am currently waiting for tale to post the RFD to recreate it.

I notice now a number of programs (zControl, COPS, Start Me Up...) which place their configuration files into the current user's home directory (as set in the HOME environment variable).

I do not see this behaviour mentioned in any of the GEM references (including the Atari Compendium).

What is the proper place for configuration files?

It seems to me that all software should place configuration files into the current user's home directory, this way multiple users can have different setups while sharing one copy of the software - saving disc space.

However, this does mean that users' home directories might become clogged up with lots of configuration files.

In addition, many people will not be running a multi-user OS, and this would not mean much to those people. I suppose that if the software did not find a HOME environment variable, it would then use the directory it resides in to store the configuration files.

The above is just my thoughts on the matter, however - what is the standard protocol to use for placing configuration files?

long Maddalt(void *start, long size)

Maddalt() informs Gemdos of the existence of additional alternative ram that would not normally be identified by the system. (gemdos >= 0.19)

'start' indicates the starting address for the block of memory to be added to the Gemdos free list. 'size' indicates the length of this block in bytes. Returns E_OK on success or negative error.

Once the ram has been identified with this call is should not be removed and only be allocated with standard system calls. In addition, programs wishing to use this ram must have their alternative ram load bit set (or use Mxalloc()). Typically this call is implemented as an auto folder program.

Quite a few of these programs won't work properly if the HOME variable is set to something like /users/root (Replace / with backslash). I had to set my HOME to u:/i:/users/root (Again / -> backslash), otherwise SMU and MultiStrip couldn't find their config-files.

Try e.g. the Blitter. you can even go on with the rest of the Program
while the blitter moves the block for you.

I'm not a demo coder. So I cann not say if the Blitter is faster than
move.l, but I guess, that the transfare in the background is a good
reason to use it.

BTW the 030er has some Instructions for Block moves. at least it is
possible to fill all the Registers iwith one Instruction and write them
out again with another.

Having a directory pointed to by a HOME variable is definitely the best way IMHO

That way, as you say, multiple users can have their own config files for
a common program. If you have only one user, and don't use Unixy stuff, then
you could always create a HOME directory called "CONFIGS" for example.

> It seems to me that all software should place configuration files into the

Most Unix software I've seen calls files ".file.cnf" - i.e. a preceding dot.
In a Unix system this will make it hidden, so listing the files from a shell
or similar will not usually show them. Unfortunately Thing shows dot files
even under a Minix filesystem :(((

The Atari desktop knows nothing about Minix filesystems anyway, so I rarely
use it now.

Depends on the software, but most things will look in their own directory at
some point. Many check the root drive and C:\MINT or C:\MULTITOS first though.

> The above is just my thoughts on the matter, however - what is the standard
> protocol to use for placing configuration files?

I'm writing a little program myself at the moment, and what I've chosen to do
is to look first for the HOME path (looking for the file both with and without
a preceding dot) then in the application path.

There is no real "standard" but more and more things are moving towards using
a HOME path (and a good thing to!).

Cheers,

Xav

My father has a Portfolio for several years; unfortunately
the battery expired before he had a chance to recharge it
this week.

When he tried to re-boot it after plugging it in, he got a
Divide by Zero error. Even a cold boot (if we're doing it
right -- it doesn't look quite like the picture) doesn't
help, he still gets the same error.

Since the manual simply says to reset and re-try or fix the
program in the event of a Divide by Zero, that's not a
whole lot of help.

Any ideas?
thanks a lot
Wendy W.

Fixed, as if by magic. By using the batteries (now recharged)
rather than the AC adapter, it began working.

PRESS RELEASE

FACE VALUE - "Visual GFA basic" for TOS computers

Visual GFA programming is now a reality. As the first GEM program
generator for GFA Basic, Face Value will create fully featured, solid,
multitasking friendly programs almost at a click of the mouse. It will
revolutionize GFA programming. Now you can devote your programming
time to the task you set out to solve, and not spend weeks - or even
months - on creating a modern GEM interface yourself. Face Value will
do that for you.

How do you work with Face Value?
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
The program design is done in a resource-editor. Here you decide how
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

the program will be presented to the user. Face Value will then load the RSC-file and write a complete, ready-to-run, solid GEM-program LST file. All you have to do is merge your own routines, and "connect" them to the Face Value-written code. This is easy to do thanks to Face Values well commented source code. The development time for your programs will be radically reduced, and as a lot of effort has gone into ease of use, even relatively inexperienced GFA programmers can now create first class, professional GEM programs.

Some features of the program:

* Windows with toolbars or toolstrips
  (as seen in modern document processors or paint programs)
* Menu bars in windows
  (Toolbox windows that will work in the background)
* Modal and non-modal dialog windows
* Animated icons (even with samples)
* Animated mouse pointers
* Realtime scrolling popup listboxes
  (radio-, check- or menu listboxes)
* Radio- and menu image popups
* Multiline radiobuttons (round) and checkboxes
* Windowed progress indicator or animated busy-dialog
* Number scrollers for numerical values
* Switchable Menu bars with automatic shortcuts
* User windows with graphics or text (or both)
* Custom desktop that can be installed/deinstalled "on the fly"
* Alerts in windows - with standard, custom or animated icons
* Iconification on all systems
* Can run as accessory, just rename to *.ACC
* Intelligent ST-Guide support (context sensitive calls to ST-Guide, automatic generation of ST-Guide sources for documentation of the menu bars and dialogs)

You can also pick & choose from Face Value's expandable library:

* Fontselector support (xFSL)
* Full Selectric support
* Drag & drop support
* GEM clipboard support
* GDOS (all types) support
* Command line support
* Off screen bitmap support (with eDVI/NVDI 2.5+)
* Load & save IMG
* and more...

What are people Saying?
~~~~~~~~~~~~~~~~~~~~~~~
"ST Format seal of approval - 90%" (august 96): "If you want to give your GFA Basic programs real 1990s interfaces, then Face Value is a must." - 90%
~~~~~~~~~~~~~~~~~~~~~~~

ST Computer: 5 of 5 mice! (january 96):"Face Value - das ist eine Revolution furGFA-Basic-Benutzer....Und die ist jede Mark wert." - 5 out of 5 mice. (high points for those of us lacking German language skills: 5 of 5 rating, A Revolution)

What do I get?
~~~~~~~~~~~~~~
The program and detailed reference are in English, and are supplied with a printed English introduction. The reference and documentation is in ST-Guide format. Example programs are included. The on-line help system ST-Guide is included on a second disk. You must supply GFA interpreter 3.5 or 3.6 and a resource construction set (ie. RCS2, ORCS or INTERFACE) these programs are NOT included with Face Value.

How do I get my copy?

It's DERCS from HISOFT which de compiles RSC files and turns it into 'C'.
It works very well on every RSC I've tried, including colour icons.

Hi folks,

I've hunted high and low for the AES opcode for the above function.
Can somebody tell me what it is please!

AES opcode for menu_unregister is 36. Note that menu_popup has the same opcode. AES distinguishes between them via the number of parameter of each type.

Cheers Peter

Hi,

As far as I know there does not exist an AES function named menu_unregister, and I can't see what use it would be for. There does exist a function called menu_register, though, but I guess you already knew that.

movem.l if you use many registers.

Don't know if the Blitter can do the work faster, but I don't think so.

Setting the screen pointer is a quite fast way! :)

The Atari Programmer's User Group

Peter Hibbs, the editor of ICTARI, the Atari programmer's disk-'zine has given me the go-ahead to put some back issues (including the current one) on a web site. He hasn't seen it yet, so it could be subject to quite a few changes. The page contains five zipped issues (averaging around 250kb each), a facility to mail articles to me, which I will then forward, and some brief notes about how the disk-based version works. You can get to the page from my home-page at:

http://www.elis.demon.co.uk/

Or, you can avoid my warped sense of humour and cut to the chase at:

http://www.elis.demon.co.uk/ictari/ictari.htm

Have fun, and tell me what you think. I'd like to add more links to other Atari programming resources in the near future. Anyway, please give it a go.

Enjoy Theeselves,
"Augeas"

Hmm, yes, well.....

I would be rather surprised if it worked on the falcon!. I have designed the pixel plot routine for ST high res mode (May work in Falcon ST High Res compatible mode), and it accesses the screen directly.

Note, that this routine was only an experiment in using Stos extensions and may not get developed further. (What with university course work and everything!)

At the moment the extension has a plot routine (for ST high res, rather fast!), and a fast version of CLS. I have figured out a way of playing chip music at the correct speed (50Hz) in high res mode, and I may put this into the extension if I can be bothered.

Would you like me to email you a copy of the extension?

Thanks for your reply!

Brian T. Innes

Well, it not quite true, unfortunately. There are two modes you can use
the Blitter in. Either only Blitter and lock the system, or share time
with the 68k. The second mode only reduced the amount of time for the two,
so they're not really working in parallel, and this wont improve the use.

> BTW the 030er has some Instructions for Block moves. at least it is
> possible to fill all the Registers iwith one Instruction and write them
> out again with another.

This isn't only 030, it's on all 68K, called movem. It's only faster than
many move.l if you use a lot of registers, don't know how many, but I
think you'll have to use eight or more.
This would be my choice, if you can spare many registers for the move.

Tomas

It's existence is mentioned in the MagiC 2 manual but no assembly binding or explanation of its purpose. From discussions on irc it seems there is a difference:

MagiC 2 app:
menu_register() then terminate removes the entry leaving a blank slot in the "desk" entry.

Magic >2 app:
menu_register() then terminate removes the entry and removes the slot.

I'm simply curious to find out if menu_unregister() removes the blank slot under MagiC 2.

I started writing one of these. I implemented enough to convert
whatever resource it was that I needed converting at the time. Email
me if you want the source (MWC K&R C) to look at.

A lead programmer is required for a major developer and publisher with international acclaim.

The job description reads as follows:

• Fully conversant with 3D engines running on the PC

• Completed at least one flight simulator for a games company in a senior or team leader role

• Experience of leading a programming team and giving direction to other programmers

On offer to the successful candidate is a competitive salary, generous bonus scheme and other company benefits.

The company is based in Gloucester, England and the candidate will have to work in house.

Please reply with your resume via private email as soon as possible and we will call you to discuss the opportunity in more detail.

We look forward to hearing from you.

Pexec(10x) is supported by MagiC 5, not by earlier versions.
If it does not work, you most probably have an older version.
I completed a french version of MagiC 5 last week (5.02).

I do not know what MWC is. But some months ago I wrote a multi-thread-safe
AES library that also contains all MagiC specific functions up to MagiC 5.
The name of this library is MT_AES and it should be available on some FTP
servers or from me (by a very long uuencoded mail).
The library is mainly writte for PureC, but it includes the complete
source code.
People talked a lot about MT-programming in MiNT but never anybody did it.
Otherwise such an AES library would have been created before.

Hello everyone.

I'm having problems with the following slimmed down printing routine -
can anyone help?? Needless to say the machine has been put into
supervisor mode beforehand . . .

```
xdef _send_centronics
xref _whatever

_send_centronics:

tstprint                ; test printer status
     btst #0,$FFFFFA01.w     ; 0 = ready for data
     bne  tstprint

     move #_whatever,d0
     bsr  writebyte2printer

     rts

writebyte2printer                ; d0 = character
     move.b   #7,$FFFF8800.w         ; set port b as output
     or.b #$c0,$FFFF8802.w

     move.b   #15,$FFFF8800.w        ; write character to port b
     move.b   d0,$FFFF8802.w

     move.b   #14,$FFFF8800.w        ; get port a bits
     move.b   $FFFF8802.w,d0
     and  #$df,d0            ; turn off bit 5
     move.b   #14,$FFFF8800.w        ; write to port a
     move.b   d0,$FFFF8802.w
```

```
     move.b   #14,$FFFF8800.w        get port a bits
     move.b   $FFFF8802.w,d0
     or   #$20,d0           turn on port a bit 5
     move.b   #14,$FFFF8800.w        right changes
     move.b   d0,$FFFF8802.w

     rts
```

TIA . . .

Use Interface. It will warn you if you are about to change the object

order, as will all good RSC editors. Interface will also let you import
IMGs directly into its icon editor.

oo-er!

>I would prefer to load the IMG file directly onto the existing icon as a
>replacement.

In order of preference ...

You need an editor where you can fix the object order manually, or
preferably stop it automatically re-ordering. My Mark Williams C
editor cannot do this, except in one circumstance, but perhaps
Interface can? I don't know.

The problem is that you have to delete the old icon before inserting

the new one. This re-orders the tree.

If you are capable with a disk editor and can fathom out the resource file header it should be possible to hack the new icon over the old provided they are the same.

The only other possible solution is to drag everything out of the tree and then put them back, one object at a time, in the same order they originally went in, using the editor's "test" feature as a guide. This is a lot of messing around and may not be feasible for various reasons.

>: Someone know the solution?

Hmm, why did I never see the original thread?

Is Pexec(100) for starting parallel apps? If so, you could use

shel_write().

```
shel_write(TRUE,TRUE,SHW_PARALLEL,exec,tail);

#define  SHW_PARALLEL  100
#define  SHW_SINGLE    101
```

Take care with the docs - there's a multitude of confusing and badly named parameters for the first 3 args. Put it this way, of the four shel_write() references I have, there are four contradictory definitions.

One of the first TRUE parameters, if passed as FALSE should invoke a non Gem process. I *think* this worked but was doing something else at the time so never confirmed it.

If you use Interface for this job (and you should, it's the best
RSC-editor yet), then you do *not* have to delete the original icon.
Simply open it for editing and then import your IMG to replace the old
icon. The object tree structure is *not* altered by this.

Did you block out the floppy vbl interrupt while accessing the sound chip?
You should set _flock around that.

Without looking too much at your code: you need to either disable the 200Hz
timer interrupt, or set flock ($43e IIRR) because otherwise the TOS timer
routine will access the PSG (and change the selected register) to check for

disk changes.

Ok here are what I am working on now... a QWK & BlueWave Offline Mail Reader
called Rejoinder. Working on the BlueWave part now, the QWK part is working
and released as Rejoinder 1.3.

See http://www.geocities.com/SiliconValley/6880/phsw.html for more.

Hideaway does not work on programs that have no windows - thus it can get around
all the problems I am having by simply manipulating windows.

>: I have been partially successful by sending a WM_TOPPED message for one of the

No, because this is handled internally in the AES - the program does not get
any message.

>: I would also like to be able to determine which application is currently in the
>: foreground. Currently, I am using menu_bar to check what menu bar is on top,
>: and checking the owner of the top window. This method fails, however, when
>: the application does not have a menu bar or any windows.
>You might check with the author of Hideaway; IIRC, it is able to do this.

Hideaway only finds programs that have windows open. Luckily, very few programs
don't have menubar or window, so it is not much of a problem.

> Hi all,

> Just out of interest - what projects are people working on??

I have been writing DESKFMT, a plug-in replacement for the MultiTOS disc formatter and copier.

<ShamelessPlug>

A list of it's features so far:

It contains the ability to run at one of three priorities - alterable on the fly.

One can create PC friendly formats, or normal Atari formats from the very restrictive SSDD 360k up to DSED 2880k. And each of the Atari formats can be extended in both tracks and sectors per track.

One can set it up to format multiple discs, prompting you when to change discs - useful when you buy no-name unformatted discs.

You can pause (stop temporarily) the format, so you can use the floppy drive for something else. Restarting the format will pick up where it left off.

You can customise the formats (ie One FAT instead of two, a smaller root directory than normal, an "odd" [strange] number of sectors per track)

The copier portion will allow you to write a copy of the disc to your hard drive as an image, as well as save just the boot sector.

You can also run that at variable priorities, pause/resume copying at the click of a mouse, create multiple discs from one source etc.

</ShamelessPlug>

Mario has been Beta testing it for a while, and I am still in the throes
of improving it prior to full release.

It works fine here, Christof. I suspect you're running into a problem
that's specific to either your system (most likely) or your university's
connection (much less likely).

there right now?"
"Yes, absolutely," replied and@sun1.mim.uni-hannover.de.
Steven moved forward, and whispered something.
 a> Organization: MiM

 a> I do not know what MWC is. But some months ago I wrote a multi-thread-
 a> safe AES library that also contains all MagiC specific functions up to
 a> MagiC 5. The name of this library is MT_AES and it should be available
 a> on some FTP servers or from me (by a very long uuencoded mail).

Any ftp addresses known? and what new AES functions are there in M5?

 a> The library is mainly writte for PureC, but it includes the complete
 a> source code.

What in assembler or C?

The most annoying thing about converting PureC code to Lattice is the Lattice uses long integers (32bits) so all the callbacks in the Windowed Dialog library are mucked up by the time Lattice receives them. In the end I had to receive the correct number of bytes in longs and use some logic to set the relevant variables.

See you earlier,

Steven

I have one here in /bin ... Judged from the huge size (56k) it came with the
MiNT-OS package available from ftp.funet.fi

Thanx for the reply Michael.

I've already disabled all interrupts (as a temporary measure) by
writing #$2700 to the status register. Wouldn't this take care of the
200Hz Timer??

What's the >flock< BTW? And how do you set it?

Any other thoughts would be appreciated.
(Sorry I took so long in replying, but Compuserve is rather
temperamental when it comes to the net - you only get so many headers
in a newsgroup. I'm using another Server now)

Cheers,

>IS this version of STOS available for purchase?

 A short explanation, Fracois Lionet in his infinite wisdom, created STOS with the ability to simply add commands on and therefore update the language by mean of extensions, once placed in the STOS folder these will add commands to the Original STOS, not only add but in most cases replicate, but with better and faster versions,

 Had mandarin still supported STOS then each time they upgraded it they would have added a number to the version, but they dropped support and it was left to third party developers to do the job, this actually had the advantage that actual STOS programmers got the opertunity to have there say in what they want,

 Subsequently STOS has had many extensions made for it, each one enhancing the language,

 You take your original old STOS, bung some extensions in the STOS folder and you then have a highly upgraded language, hence a whole new 1996 version of STOS,

 Goodmans pdl will supply you with any extensions needed and indeed are the shareware holders for two of the most important, ie: Misty and Missing link extensions,

 I program with a far enhanced version of STOS than the original, as far as I am concerned its been upgraded and is the 1996 version, I hope my original post and indeed this one dident confuse anything :)

Hi there!

I'm wishing to convert some images I have into icons/images that I will be able to insert into resource files that I'm working on. What format of image does Hisoft's WImage need to be able to convert into a format that can be then imported into WERCS? ie is it GIF, TGA, JPG? etc...

TIA for any help,

Chris W.

Hmmm, I'm not sure about your code, but, to put it bluntly, it looks pretty wrong.

PSG register 7 is actually the Mixer control (pure note + noise enable/disable) and is, according to my docs also supposed to be IO control as well, though if so it's only the top two bits (the bottom six are channels 1-3 pure note on/off, channels 1-3 noise on/off).

The following routine will send a text file to the printer:

<---begin code--->

```
; Simple code to print a text file
;
     clr.l    -(sp)              ;    supervisor
     move.w   #32,-(sp)
     trap #1
     addq.l   #6,sp
     move.l   d0,old_usp         ;    save stack
     lea.l    file,a0            ;    a0->text file
     move.b   (a0)+,d0      ;    get first character
send_loop
     bsr  to_printer        ;    send it
     move.b   (a0)+,d0      ;    get next
     cmp.b    #$ff,d0            ;    end of file?
     bne.s    send_loop     ;    no, so continue sending characters
     move.l   old_usp,-(sp)      ;    user
     move.w   #32,-(sp)
     trap #1
     addq.l   #6,sp
     clr.w    -(sp)              ;    exit
     trap #1
;
to_printer
     move.b   #14,$ffff8800.w        ;    IO port A
     ori.b    #$60,$ffff8802.w   ;    centronics STROBE, general purpose OP
tp_online
     btst.b   #0,$fffffa01.w         ;    printer online?
     bne.s    tp_online
     move.b   #14,$ffff8800.w        ;    IO port A
     move.b   #1,$ffff8802.w         ;    printer font
     move.b   #15,$ffff8800.w        ;    IO port B - centronics output
     move.b   d0,$ffff8802.w         ;    character
     rts
     SECTION  DATA
file incbin   "a:\filename.ext"
     dc.b $ff
     SECTION  BSS
     even
old_usp  ds.l 1
```

<---end code--->

Funnily eno\ugh, just a week ago I'd borrowed the Amiga cartridge of Mastersound 2 (which works via the printer port) in the intention of utilising it via the ST's printer port. After much TRAP following, and disassembling I gave up as it all seemed too complicated....and then I saw your routine and realised how it worked!

I'm still not 100% sure about the actual workings of this routine however...

According to my docs, $ffff8802.w is used for floppy drive side select, and some other disk stuff, but also for the centronics STROBE and general purpose output (both 1 bit each). I figured selecting these two was important so did an ORI.B to turn the bits on. I assume that port A controls all that lot...

Next an online check, then select port A again and set it, then port B for centronics output and send the character. This is where my logic begins to falter: if port A was used to select the STROBE and general-purpose output (and port A also then handles the disk stuff) how it selects the printer font I've no idea. Mind you - that's only a guess that it selects the font. I originally send do to it as well but that ended up printing rubbish when I did a character test (sending 32-255 to the printer). I tried it with 1 to port A and it did the normal ascii stuff. Different values seem to select different characters, though the upper-case alphabet always appears to be there...I've seen blocks (differnt gray scales) and line-drawing characters (you know, horizontal, vertical, corners, 3-way, 4-way, etc). Sending 1 seems to work fine.

So if this is the case then how am I selecting the STROBE and gp output?!
If you remove those two lines then it doesn't seem to work!
And not selecting port A before sending the character stops it working!
And does removing the online check!

This works fine on my Epson printer, it may vary with other printers, though I suspect most are Epson compatible or work in the same (or similar) way. Note that tab sizes are selected by the printer, and are not consistent with what's on screen (mine uses 8 characters for a tab, but I prefer 4...) if you change tab size from the normal. Might be an idea to do a check for tabs and then send some spaces so you can have variable tab sizes...

I coded this with Devpac 2 and I`ve tested it and it works ok. Hopefully it'll work fine for you too.

I was sure there was something else I was going to say but...

Questions, comments fling 'em my way. Oh yeah, should be able to set tab size by escape codes to the printer, but...it's a lot of messing about. Probably easier just sending spaces. If anyone wants the docs I've got on system variables or on $ffff8800.w and $ffff8802.w and the MFP, etc. give me an email.

It doesn't. Font selection in all printers (assuming you're talking about
internal fonts) is via a control-escape sequence or something similar. If
you want to select a printer font under GDOS, it's still a different kettle
of fish, having nothing to do with the port.

What if you send this message not to the program itself, but to the AES - should$nt that trigger a message from the AES to the target program?

I'm writing a really grotty fractal proglette. (Well, one day it might not be so grotty..) Instead of being restricted to z^2+u you can enter almost any complex expression -i.e. z^3 + cos(z) + z^z + u and it *should* be able to do it. Runs at an absoloute crawl, though, and what's worse is that it's the worst form of alert-ware and only likes standard ST resoloutions. I might clean up my act later. Did anyone get my even sillier (but prettier) sierpinski gasket prog from the PENSKE BBS ?

Have Fun,
"Augeas"

I dunno if its relevent and I can't remember any details but FLOCK
might need to be dealt with (word at $43E).

Hi, Chris

The image format should be DEGAS (.PI3).
I've created some icons myself.
-Great fun!

Hello, I've just installed the T.A.F. MiNT distribution, and am now trying to get Gcc to work. I'm using the archives from the other MiNT distribution, (not KMGD...) all the .zoos were extracted to the right directories and I copied the environment variables from the MINT.CNF file into the one supplied by T.A.F. I type out a little proglette:

```
#include<stdio.h>
int main()
{
printf("Hello World ! /n");
return 0;
}
```

Typing gcc hello.c doesn't do anything ! Using the -v option showed that only the pre-proscessor had been run. No error messages and certainly no trace of a.out...
Help.

Also, has anyone managed to port a X11 version of Gnuplot ? what about the X version of Fractint...

Have Fun,
"Augeas"

Thanks for the feedback.

Mmm... Segmentation fault... so you're using a Unix System to browse. Well, I don't have a browser on my Sun Ultra, I am using Netscape 3.0 on NT4/Pentium, where I developed those pages. I wonder if all the pages or just the 1st enterance page. The other browser I tested with was CAB 1.3 which works, but without the animated graphics. I will try to install a browser on the Ultra & test it out.

You can try -
  http://www.geocities.com/SiliconValley/6880/phsw2.html
which where the 1st page auto jumps to for Netscape, if the 1st page crash on you.

You can also try
  http://www.geocities.com/SiliconValley/6880/phem.html
as this page don't have any animated graphics, just text plus a background.

let me know. Thanks.

I never thought of that. However, it still
may be a problem, since I will not know where in the menu the program is
listed. Maybe, however, they are always sorted by application identifyer
in the desk menu, in which case I should be able to calculate which menu
entry to activate. It is worth a try.

VERSION 0.6 OF TRS-80 EMULATOR FOR ATARI COMPUTERS AVAILABLE

Now you can download the TRS-80 model III emulator version 0.6. The package includes basic programs, machine language programs and NEWDOS/80 on 3 virtual disks. It also has a MagicMac compatibility mode and runs in all monochrome video modes. To download it go to the Atari page of

http://www.pi.net/~volatile/

The package now consists of two .ZIP files. TRS80V06.ZIP contains the minimum configuration. TRS80X06.ZIP contains conversion software and software for exchanging files between the Model III and your Atari. It also contains extra documentation.

Changes:
- Support of all monochrome video modes starting with ST high;
- Support of virtual disks with any number of tracks and sectors per track.
- ROM tape routines rerouted to disk file. This could be used by Tape to Disk copy programs. Note that the current optional CLOAD, CSAVE and SYSTEM rerouting is not changed;
- Snapshot loading/saving added. Memory, registers and options are saved;
- Changed settings on NEWDOS/80 disk. Disk 3 now defined as SS/SD disk

for Model 1 disks;
- Startup message;
- NEWDOS/80 info translated to ASCII
- 2nd Connection and 2nd Convert added to the package;
- Manual, BASIC manual and other info included.

Using the included SPEED.BAS the following speed results were obtained
(all numbers relative to a 2 Mhz TRS80 model III)

Tested item	ST	STE	Falcon16	TT*	630**	
Integer	43	85	83	170	510	%
Floating Point	32	59	60	121	392	%
Memory	45	86	88	182	530	%
Text	170	311	311	530	1766	%
Scrolling	60	131	217	333	714	%

* TT RAM
** Apple Performa 630 running MagicMac 1.2.5
(for these tests the options "disk system" and "speed adapt" were disabled, "video acceleration and clock adapt" were enabled. The real time clock was set to "normal")

Send an email to me if you want to be added to the 2nd Life mailinglist. I will use this list to notify you about new updates, tips and tricks.

 Yes but even though I love my ATARI and spend most of the day using
it, programming mainly (keeping on topic<G>) I actually use my PC for
internet access, so am in shtuk :(

 Nice idea though :)

Try GNU C or Sozobon C

I use to work with GNU, it have some bug (prototyp problems), but if you
have enough memory, it is not so bad.

Hi,

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

I don't know. I can not get the other Pages as well.

> The other browser I tested with was CAB 1.3 which works, but
> without the animated graphics. I will try to install a browser on the Ultra &
> test it out.

I use an Alpha running DIGITAL UNIX. for browsing. This only hapens with
Netscape. Mosaic has no problem with it. I also tried HotJava and Arena
on a SUN - No Problem. It really seems to be a bug in Netscape. Don't
ask me, what the Problem is.

> You can try -
> http://www.geocities.com/SiliconValley/6880/phsw2.html
> which where the 1st page auto jumps to for Netscape, if the 1st page crash on

This one crashes as well.

> You can also try
> http://www.geocities.com/SiliconValley/6880/phem.html

> as this page don't have any animated graphics, just text plus a background.

This one has no Problem. There seem to be Problems with the Animated
GIFS (?). Just find out all the differences between the two Pages. We
can try then (email me).

I don't know of any worthwhile educational software,
but certainly the old AtariWriter word processor in
cartridge form works just fine with no disk or even
(if you don't mind not being able to save your work)
cassette. Of course, without a printer it doesn't do
anything worthwhile.

I assume that the reason you want a cartridge is becuz
you don't have a disk drive? If you DO have a disk
drive, then there are a lot more choices.

 Someone mentioned you where having a relative tantrum in N.ST.FORMAT
 I was told that just before it all finished, STF sent out copies of
PCFormat as some sort of prezzie to STF subscribers:) ?

>Now tell me slowly and in big letters, what is STOS, and what do you do with
>it. 8~)))

 Ho alright, simple question ;), take one chair and one stool and one
stos (stos should be made of cork, 4 inch in diameter and taper off to
a point at the top), place stos on chair (pointy end up), then stand
on stool, leap off the stool so as to land in a sitting position on
the chair, you should now know what to do with your stos :)

><Shameless plug alert>. 8~)))

 "plug" ? ho you already knew then :)

Cheers.....!ynoT

Right, that prevents all such problems.

SW>What's the >flock< BTW? And how do you set it?

It's a documentes TOS system variable at $43e, which is set when anyone
accesses the floppy drive. As a side effect, it makes the VBL routine not
access the PSG registers.

Greetings, Atari experts.

I have recently been working on a small utilitie that functions as a small resident applications that can be used to add animations and some cool window opening and closing effects. It functions both as an accessory and application, and works both under Single-TOS, MiNT/Multi-TOS, XaAES (Reported by a beta-tester), Geneva and MagiC (Also reported by a beta-tester). It doesn't hook up to any system vectors, but lies resident waiting for messages from other programs, and understand the basic AES messages that can be thrown at it. Since it only uses documented AES and VDI calls that have existed since TOS 1.00, it should, in theory, be downwards compatible all the way.

On a bog-standard Falcon equipped with four megs of RAM running Magic it uses only about 3% of CPU time to display a 64x64 16-color animation at ten frames/second, so there's no problem in that department :)

I am looking for people to help me develop the program, and I'm trying to get people insterested in using these effects in their GEM applications. I think it would be cool if more utilities could get more graphically pleasing to use, wouldn't it? How about an animation while depacking data in ST-Zip or Lharc? While defragmenting a harddrive? While copying data? While reading mail or news? Or just an animation on the desktop, just for fun? It can be done! I just need some inspiration and help.

Limitations of the program:

- It does not convert animations between number of bitplanes - i.e. a 16-color animation only works in a 16-color mode. (actually, if the VDI rastercopy function is debugged a little, it will be possible to display a 16-color animation in both 256 color, high color and true color as well, but all current implementation of that functions do not convert between bitplanes.
- It only supports two fileformats (Neochrome and True Paint Image), which I

think should be improved.
- It does not, as of yet, support packed animations (Which is too bad, as a ten-
frame animation of 64x64 pixels in 16 colors stored in the True Paint format
takes over 20K, and can be packed down to about 500 bytes with Lharc!
- An animation needs to be displayed on a resource object in order to be

positioned correctly (If a window containing an animation is moved, my program
only needs to check the XY-coordinate of the resource object that is to become
an animation to know where to display it next.
- As of this moment, it only support one effect at the time, but that will change.

Development plans:
- Support for packed aniamtion files.
- Perhaps a unique animation-file system, or implementation of an existing system.
- Multiple animation support.
- Further development of the window opening and closing effects. (As of right now,
it is possible to have the program close a window ten pixels at a time, or in
ten steps, or any other number of pixels/time or steps. I want to make it even
better... The window opening effect will be reversed way, with opening the
window ten pixels at a time, and drawing the contents while doing so... It goes
without saying that this is kind of slow on most systems, but with a speedy
graphics card with accelleration (NVDI comes to mind) it actually looks good!
- Does anybody have any ideas?

So, then it's just to sit around and wait for response. The source code is available upon
request, as is a beta copy of Antidote, my virus killer, which uses an animation while
reading bootsectors, just for the heck of it.

And the name of the program? Well, I haven't decided on that yet, but the working title is
GEM-FX MkII (There was a MkI, but I wrote it in GFA Basic ages ago and it was loathsome),
and it is currently being programmed in Pure C.

It takes about 10K of RAM at the current state of development.

Comments, ideas, criticism, anyone? Please forward all postings to me by mail, as I don't
very often come down to reading rews...

- Kai

Could anyone point me towards Atari's Assembler Editor cartridge?
I'm putting togather an 8-bit system so that I can get back into programming but I can't find one of these carts.
Any help would be greatly appreciated.

You don't need a Modem. If your PC has Internat acess you can install a
Slip conection via a nullmodem Cable between the PC and the Atari. Even
STiK can do that. Still if Ram is not the Problem on your Atari I woult
prefer to install MiNT and MiNTNet. There is al lot more software
available for this Combination. So you can use your Atari and the PC for
Internet Access at the same Time. By the way you have a TCP/IP conection
between your PC and yout Atari. So you can use stuff like ftp or even
NFS for transfering files between the two.

Take a look at my Atari Bookmarks page
(http://www.3rdplanet.com/~starship/atari.htm) and you can get Wormhole, NOS,
and assorted other useful stuff. Paul Baker is the responsible party for
Net2Net. If you want to manually decode/encode your UUcoded email packets,
you don't even need Wormhole or N2N - a bare-bones system would include STiK,
Antmail, Swampdog's UUcode thingy (name escapes me ATM, sorry), IOSmail,
Tmail, and STzip. Fancier methods are possible, but that's the minimum
recommendation I could make.

Not stuck at all, Tony. You can get your packets via email on the PC,
UUdecode them to a floppy, then bung them into the Atari for processing,
reading, reply, or ignoring. Reverse the process to send your outbound.
Shoot, you can even use Ghostlink and avoid the floppy altogether.

Hi,

PLEASE - I NEED A QUICK ANSWER - I NEED REALLY QUICKLY TO MAKE THIS
CARD RUNNING !! ...

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030, in BNC ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?

Could you give me more informations about the jumpers because I have
no documentation of them !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herv

From me, or from Paul Baker, or from any NeST sysop with an email account, a small amount of technical know-how, and a big heart. For the moment, if you want to choose the message areas, you need a NeST address. Read on...

 >> UUdecode them to a floppy, then bung them into the Atari for processing,

It's easy enough, yes.

 >> Shoot, you can even use Ghostlink and avoid the floppy altogether.
 s>
 s> bit difficult, st upstairs, pc down :)

Wire is cheap, and RS-232 will support rather long runs usually - up to a couple of hundred feet, anyway.

s> Hers a question, hope its viable, is it possible to recieve it via
s> email as a QWK package then use something like KIVI or simmilar OLR to
s> read and reply, then send back as a return QWK package, that would be
s> EVERYONES answer surely?:)

ATM, no - it would require too much manual setup on the sysop's end. Later, when I have a real UUCP here, yes, it will be possible, but right now, your best option is a NeST private node.

s> If not then can I have exact details on how to do this,
s>
s> not an url...details please if poss, I really would like to get
s> back to messaging in NeST.....<SMILE>

OK, you need to obtain all of the following:

NESTKIT (includes the NeST application and a NeSTlist, not necessarily the latest, however).
BTNC
IOSmail or Jetmail (IOS is freeware; Jetmail is faster and a bit less buggy)
Tmail, LED, or other fido-style message reader
Suitable archiver(s) (STzip recommended; ARC supported; LHA acceptable but not recommended due to too many semi-compatible versions)
UUcode software (ESScode or Guy Harrison's UUcoder recommended)

Patience.

You have to fill in your NeST app and submit it as a private node to whomever you wish to get your feed from with a request to have it forwarded to the proper RC. Use the temporary address (90:XXX/999.0 where XXX is the rgion you'll be connecting to) to set up BTNC, IOS/Jetmail, and your mail reader while you wait for a reply.

You /must/ be able to write and pack netmail in order to get a node number. The only tricky part will be manually UUcoding the outbound packets, which must be emailed to AUTONET at your host system (me or Paul, or whoever else joins the club). The email subject should be "AUTONET Packet" - the content should be nothing but the UUcoded fido packet.

When you get email addressed to AUTONET (or with AUTONET packet in the subject line), UUdecode it to a floppy and move it to your INBOUND folder, or UUdecode it directly to INBOUND. Then run IOS or Jetmail to import the packet.

It sounds complex, but the whole process takes less than a minute once you have your private node set up.

All the necessary files are available at ftp://ftp.teleport.com/users/atari

Good luck!

It's possible but we'd have to agree who would do it... May I suggest that all NeST SysOps with Internet access send a few Nest echos each? BTW -It also works for file echos.

ATB,
    Karl.

Sorry to take so long, but I just happened to decide to get Linux going on my
Falcon
and went to the Linux newsgroups, and guess what I found in comp.os.linux.m68k?

He goes on to say they're worth about $100. Check out the thread, maybe someone
there can help.

Good luck!

Dan

My internet access isn't charged by the minute, so I'm the logical candidate.
However... Ever since my ISP "upgraded" his OS, inbound email works ONLY with
Antmail, which is a PITA. I'm working on getting a "true" UUCP account, and
when that is accomplished, this whole idea will be much easier to implement
from my end.

But if you get setup as a point first there is no need to worry about sending
NETmails as you don't need to send in forms.

Also, when I became a point of STandard (Karl Foley's board), I was sent an
LZh archive containing all the software preconfigured for my point so all I
had to do was expand it to my floppies as I was using then and work out how
to run it :)

 s> It sounds complex, but the whole process takes less than a minute once
 s> you have your private node set up.

Someone ought to write a program to scan your emails and automatically
extract any NeST stuff. Couldn't this be added to net2net or something?

See you earlier,

Steven

"Ambassador Foley," asked Steven. "Do you really want to know what's going on down there right now?"
"Yes, absolutely," replied Karl.
Steven moved forward, and whispered something.

 KF> Nope - Net2Net converts FTN newsgroups to email - It doesn't matter
 KF> what machine you use, if it reads email you can use it.

I suppose you could set some PC(spit!) fido software up and do it all on the PC, if you really wanted to.

 s>> Nice idea though :)
 KF>
 KF> Still is!

Especially if you get connected through STandard, if he's offering email NeST. Karl's got all the software preconfigured to run from Semper so it shouldn't be much trouble to drop the decoded packets into the INBOUND pa

Hope I haven't dropped you in anything Karl :)

1) Obtain data book from Zilog or AMD
2) Look at linux device driver: tsx-11.mit.edu:pub/linux/680x0/
   Browse around in there, and you'll find source code for various
   kernel versions. Grab any of them (preferably 1.2.13pl.. or 2.0...)
   When you decompress the .tar.gz archive, look in
   drivers/char/atari_SCC.c and .h

E-mail me if you need more info,

Art

How does one detect which floppy controller a computer has?

As part of my DESKFMT program (a plug-in replacement for the MultiTOS disc format/copier), I would like to be able to detect which floppy controller is fitted to the machine, so I can auto-configure the program and disallow capabilities above and beyond that available from the FDC.

Other than looking for the _FDC cookie and the _SWI cookie, what else can I do?

The _FDC cookie will not, AFAIK, be available in TOS versions prior to 4.

The _SWI is available from v1.06.

However, both are unavailable on TOS 1.04, as 1.04 has no cookie jar.

And, of course, they could be mis-programmed (ie incorrect cookie data)

The _FDC cookie will not, AFAIK, be available in TOS versions prior to 4.

The _SWI is available from v1.06.

However, both are of little use on a TOS 1.04 machine.

And, of course, the cookies could have incorrect data.

BTW: I am using Lattice C 5.60.

Hello,

Does anybody know how I can redirect the output of a TOS program and process this output myself ?

I would like to launch programs via the shell vector and than put the output myself on the screen. I believe that is exactly what Gemini does. I thought it could be done without bending vectors, just by using Fdup and Fforce but until now I didn't have any success.

Greetings,

Dirk Nissen.

Last time I looked, points weren't allowed. Having just perused the current
Nest Policy document (.196), it appears that that particular restriction has
evaporated.

> s> IOSmail or Jetmail (IOS is freeware; Jetmail is faster and a bit less

>STe under MagiC 4.

Oh, for anyone who is short on funds or not carrying tons of message areas, IOS is great. I used it myself quite a while ago, and it was a VAST improvement over what I had used previously (ACS? Long time ago, I'd have to ask Vroomfondle). For a system like mine, with over 100 message bases and 4 or more networks (I lose count), Jetmail is better.

> s> buggy) Tmail, LED, or other fido-style message reader
>
>LED v1.22 is also freeware, or you could just wait for my NewsAgent program.

I wasn't aware that LED had ever been freeware. It's currently on 1.4x, innit?

And what about Newsagent, then? Specifications, please.

>I use LHarc with my mail to and from STandard everyday with no problems.
>Providing you use the same version as your sysop you'll have no problems

Key words being "same version" - which was my point. If you ever link a system run by a PC Puke<tm> (as I will be doing shortly), Zip is better anyway - they have SUCH difficulty with everything else. <G>

Not that I can see now, no. However, anyone linking to me will have to fill out an app anyhow - point or node, I want details for use when troubleshooting.

Not for forms, no. However, I didn't notice it in the Nest Policy, but Fido Policy requires the ability to send and receive netmail as a prerequisite for membership. I feel that's important, else how is your uplink going to let you know that your system is wonky? In email, if you have Internet access (which is what this whole thread is about, of course), but netmail is still a vital part of any ftn.

Could be added to Wormhole, and since my ISP has bunged up email for NOS, I
think I'll do that Real Soon Now. I'm tired of manually UUdecoding packets.

i have been tested 3 emulators on my p.c. tos2win,gemulator 96,and magic pc
(demo version)
the ratio of compatibility is under at 10%
every atari software then i've been tested not works at 90%
well ! this is my questions :
1) if i had the rom card with G.E.M. in my p.c. they are much compatibility with these 3 emulators ???

2)they are anybody here can i have 1 of these 3 emulators whith G.E.M. card
and what are the compatibility ??

3) what of these 3 emulators is better

4) thank's to all for your answer because i want to buy this solution but
the report of compatibility in demo version does not seduct me !

TO BE CONTINUED....

5) AND NOW I KNOW WHY GEMULATOR DOES NOT SUPPORT A LOT OF
 ST FLOPPY BECAUSE IF YOU HAVE DISK FORMATED AT 10 SECTORS PER TRACK
GEMULATOR CAN NOT READ THIS FORMAT THIS IS A REAL PROBLEM BECAUSE ALL THE
ST GAMES ARE IN THIS FORMAT FOR EX:DUNGEON MASTER !
IF THERE ARE ANYBODY HERE CAN KNOW AN EMULATOR CAN SUPPORT THIS FORMAT
PLEASE HELP ME AND SEND ME A MAIL !!!

BYE ALL ! FROM DDRCREW !

newsgroups: comp.sys.atari.programmer

Hello Everyone,

I recently joined the group of Falcon owners.
My Falcon already has a Falconspeed already installed, and there is an
accelerator that is not yet installed.
I checked out the accellerator (from Digital Data Deicke [a German firm]) and
it consists of nothing more than three little black boxes with labels on them
and wires coming out.
On the labels is a description telling which wire is to be connected to which
pin.
Two of the boxes definetely have cristals in them (one supplies 40Mhz to the
68030 and one supplies 50Mhz to the dsp)
The owner, which I definetely *DO* trust btw, told me he hadn't the
experience to do it.
Now I have some problems:
-I don't know if this accellerator thingy works with the falconspeed.
-I don't know if I can still install a coprocessor.
-If a copro can be installed, I don't know which one (what clock speed)
-I don't know what I have to do to make sure that my Falcon doesn't spit
smoke after running with the accellerator gizmo.

Oh phuuuleez someone help meee,

Herman

Most of this stuff should be readily available via my bookmarks page. The
"Captain's Seachest" links to my ftp space, and I'm filling that up all too
quickly (only 5 megs available space, I'm sorry to say).

>Someone also mentioned a program that helps in setting up Binkley, that

I use Semper, so I really don't know about that. Bill Scull is the current
developer of BTST - best to ask him in AtariNet.

Hi,

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

Hi!
I'm trying to get the speech routines (@initio.speech & @talk) from
Gfaexpert to work in GFA-basic 3.5, but all I get is 2 bombs.
Does anybody have any experience with using these routines or know
what could be wrong with the code.
Here are the routines:

```
'
PROCEDURE initio.speech
  ' *** uses STSPEECH.TOS to speak
  ' *** RESERVE doesn't function, therefore reset necessary
  ' *** don't be surprised by a sudden freeze or some bombs
  ' *** routine by Dave Morrison
  ' *** uses Standard Procedure
  LOCAL i%,k%,bpage%,prg%,phoneme$,speech$,m$
  file$="I:\HIGH_MED\SOUND\STSPEECH.TOS"                ! or other
path
  IF NOT EXIST(file$)
    ALERT 3,"Can't find| |STSPEECH.TOS|",1,"EXIT",button
    @exit
  ENDIF
  RESERVE FRE(0)-29000
  bpage%=EXEC(3,file$,"","")
  IF bpage%>0
    prg%=bpage%+&H100
    POKE prg%+&HE,&H4E
    POKE prg%+&HF,&H75
    POKE prg%+&H6C,&H4E
    POKE prg%+&H6D,&H75
    speech_buf%=prg%+&H6EEE
    POKE speech_buf%,&HFE
    phoneme%=prg%+&H32
    speech%=prg%+&H88
    RESTORE speech_data
    FOR i%=1 TO 6
```

```
      READ k%
      phoneme$=phoneme$+CHR$(k%)
      speech$=speech$+CHR$(k%)
    NEXT i%
    phoneme$=phoneme$+MKL$(phenome%)
    speech$=speech$+MKL$(speech%)
    FOR i%=1 TO 6
      READ k%
      phoneme$=phoneme$+CHR$(k%)
      speech$=speech$+CHR$(k%)
    NEXT i%
    phoneme%=VARPTR(phoneme$)
    speech%=VARPTR(speech$)
  ELSE
    m$="*** ERROR ***| |EXEC 3 returns|    "+STR$(bpage%)
    ALERT 3,m$,1,"EXIT",k
    @exit
  ENDIF
  '
speech_data:

Degas.
It's best to grab the image you've done in Degas using tyhe rubberband method in WImage. If you grab a few pixels too many around the image you can edit them out in WERCS and set the image size accordingly.

AFAIK, the game 'FRONTIER' (Elite II) uses 32 colours per screen in low
res, therefore getting 32 colours should be reasonably light on CPU
cycles, since the game is still very playable.

A second hand 1 Meg STe should be around $200.

Hmm, I seem to have missed the original post...

I'm still working on UUCP-ST and Wormhole and plan to continue to do so
until (a) They're complete to my satisfaction and that of all registered
users, or (b) I finally get the message that no one wants to register
(which seems to be the case so far).

Looking for someone with tos 206, prefrably switchable?, that will test a game for me this weekend and get back to me asap,

will be a file less than one meg...probably half or so, that they can download from my page, i just give them the url, they then email me and tell me if it worked?, thats simple,

Will be ready probably over weekend or during week,

So anyone available to test for me please, tos 206, 1 meg, prefrably ste, must have access to normal tos so as to compare?

FANX :)

Cheers.....!ynoT

Greetings,
  The problem is that the software that I want to create must at least have 32 colors on screen, and that is easy on the PC and Amiga, but after reading what the other person said, I am not sure anymore, and an Atari costs SO MUCH money for that just 16 colors. If it would have cost 200$ for Atari STe with 1 meg ram, I would have probably bought one to program on it... but it costs 400$ ... and you just get 16 colors, even though the sound is very good. I will have to think about it.

Good gods, man, who is trying to sell you an STe for $400?!? I see them all the time for $150 to $200 (US - that's still far below the $400 CAN you're talking about). There's a fellow in Vacnouver, WA who has one he's asking US$200 for - want me to look him up for you?

What's the first line in your NNTP.DAT file look like?
And what do you have entered in STARTUP.NOS for nntp server?
It sounds as if you have no news server listed in STARTUP.NOS

I'm now back in fuji-land after getting a replacement Falcon and still
working on "Bomb Squad", an arcade game for the Falcon. It's written in a
mixture of STOS and assembler. Info can be found at
http://student.canberra.edu.au/~u943409/bomb_squad.html

> Also I am putting some C++ classes together for an X-File-y text adventure

Cool! I read a post about this topic a while back and was wondering if
any1 had got it working. Is the helper prog source available? I assume it
sticks a pointer to the command line string somewhere and calls the prog
using pexec?

I am working on a couple of projects including getting the code from the
book 'Black Art of 3D Game Programming' to work on the Falcon. So far
I've got the first 4 chapters worth of code working in True Color low
res(it seemed easier than working with the 256 color bitplane mode). I am
also playing around with a multithreading extension for TOS. It's tied to
the VBI for now.

Sorry to post this to your newsgroup, but I had to try it!

I read this and thought, "What could I lose?"
Read through it and maybe you'll like to try it as well!
But please be honest. That is how it works.

"MAKE-MONEY-FAST"

----- Adapted article by Jody Vining (#4 below) ----------

Want to make a few bucks? Quick, easy and cheap?

Ok ok, we have all heard this before, laughed at it, thought it was stupid, so did I. But one day, I was bored, and wanted to see if this thing really works, the now infamous newsgroup "make-money-fast" routine.
And well, to my surprise, it ACTUALLY WORKED. I didn't make $50,000 like some said, but I DID make $3,200 in 1 month. Thats not bad for a $5 investment!

So now try it, maybe you'll make less, maybe you'll make more, but its worth a shot right?

The procedure is very simple.

STEP 1. Write your name and address on 5 separate pieces of paper with the words "PLEASE ADD ME TO YOUR MAILING LIST". Fold a $1 note or money order or bank draft in each of the pieces of paper and mail them to the following five addresses:

---
1. Sahba Zadeh, 16115 122 Pl. NE, Bothell, WA 98011, USA

2. John England, 570 Vista Ave. Palo Alto, CA 94306, USA

3. Jeannette Bidegain, 2301 Redwood Street, #1406, Las Vegas, NV
    89102,USA

4. Jody Vining, 987 Shetland Ave, Winter Springs, FL, 32708

5. Mitch Whiteley, 1026 N. 510 W. Apt. 4A, Logan, UT 84341

STEP 2. Now remove the 1st name on the list, move the other 4 names up (5 becomes 4, 4 becomes 3 etc) and put your name and address as number 5 on the list. You can do this by re-typing this article or simply editing and re-posting it in this or another newsgroup.

STEP 3. Post your amended article to at least 200 new groups (there are 17 000 of them).

You are now in the Mail Order Investment Business and you will start receiving $1 returns by mail within a week or two. The more newsgroups you post to, the bigger your return will be. You may want to rent a Post Office Box to handle the volume of mail you are likely to receive.

If you wish to remain anonymous, you can use a pseudonym such as "The Manager" or "The Investor", but make sure your address is correct!

NOW LET ME TELL YOU WHY THIS SYSTEM WORKS!

Of every 200 postings I made, I received an average of 5 replies, YES - ONLY 5, each with a $1 bill enclosed. You make $5 for every 200 postings WITH YOUR NAME AT NUMBER 5.

Each person who sent you $1, now also makes let's say,only 200 additional postings WITH YOUR NAME AT NUMBER 4, i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at number 4. You make $50.

Your 50 new agents make 200 posting each WITH YOUR NAME AT NUMBER 3 or 10 000 postings - average return 500 at $1 each is $500. They make 200 postings each WITH YOUR NAME AT NUMBER 2 = 100 000 postings = 5 000 returns at $1 each = $5 000.

Finally, 5 000 people make 200 postings each WITH YOUR NAME AT NUMBER 1 and you get a return of $50 000 before you name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE ONLY MAKES 200 POSTINGS! Total income in one cycle = $55 500.

From time to time, when your name is no longer on the list, you take the latest posting that is appearing in the newsgroups, SEND OUT ANOTHER $5 TO THE NAMES THAT ARE ON THE LIST, PUT YOUR NAME IN AT NUMBER 5 AND START POSTING AGAIN. Remember, 200 postings is only a guideline. The more you post, the greater the return.

Let's review the reasons why you should do this: THE ONLY COST FACTORS ARE 5 STAMPS, 5 ENVELOPES, AND 5 $1 BILLS. Anyone can afford five dollars to put into such an effortless investment with SPECTACULAR RETURNS.

Some people have said to me "What happens if the scheme is 'played out' and no one sends me any money"? Big deal! So you lose $5 - but what are the chances of that happening?

Do you realise how many Internet Users there are? Do you realise how many times this scheme can be utilised over and over again - with COMPLETELY NEW people participating?

There are not HUNDREDS, NOT EVEN THOUSANDS, BUT HUNDREDS OF THOUSANDS OF NEW INTERNET USERS EVERY MONTH!

Remember, read the instructions carefully and play FAIRLY...that's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroup postings to make sure everyone is playing fairly. You know where your name should be.

Hi!

I've tried to install MiNT and the Minix filesystem using
MINIT.TTP (minit.ttp -V -n 4 G:, where G: is a 200 MB partition
of an external SCSI drive) ... but nothing works. I downloaded the
MiNT distribution kit (9 disks), extracted disk 1, put everything
on a floppy as the docs says and then ran setup and config
from the floppy. However, MINIT.TTP just writes something
at the screen and then immediately exits. I tried
minit.ttp -V -n 4 G: by hand and it didn't work either.

I tried with the .XFS file in the MINT folder and
MINT.PRG in the AUTO folder but nothing works. Do I have to
boot with MINT.PRG and the .XFS file before executing MINIT.TTP ?

What might be wrong ?

I have a F030 (C-lab), 68881, 4 MB RAM, internal 500 MB SCSI
(C boot partition and C program partition) and an external
1 GB SCSI (E,F,G,H,I partitions) . Oh, I also had the control
panel, blow-up soft and FPATCH2 installed when I tried.

I do this just to be able to install Linux later, on top of
the Minix FS :-)
I tried finding the usr.tar.gz and root.tar.gz files for 68k-linux
but they seemed to have disappeared from most 68k-linux and replaced
in some cases by something called the watchtower-2 file system. It it
possible to use this file system. I mean, it's about 15 MB so some advice
would be nice to have before starting to ... huh ... download it.

HI;

I'm looking for a little help and advice from the Atari programming community. Several years ago, when i owned a 520ST i purchased Mark Williams C for the Atari ST. Things went on and bla bla bla... Now I own a Falcon 030 And am wondering if i continue using MWC where would i get .h files to program for the Falcon. Also the .RSC file for MWC only will allow the older screen resolutions, can any of this be brought up to date?? Is MWC still supported? Do they have an E-Mail address i can get in touch with them??

Any help would be appreciated. I haven't done any programming for years and it's like starting all over again with a new Atari.

I'll reply to this one, everyone, since I did a bit of research on my own to come up with what he's asking. He's asking a similar question to what I

asked before.

Mark Williams Company made Mark Williams C as you've noticed. The final release was 3.0.9 back in around 1988 or 1989, and then they went dormant for several years, until very early 1995 when they went out of business. There was also something about Coherent, which is a Unix clone for the IBM systems, and have their own newsgroup, comp.os.coherent, and you can find at least some of the ex-employees of there and MWC. I was in contact with a few ex-employees, including the sysadmin out there, Joe Dennison. I've not been able to find the owner of the company, Bob Swartz. I had an email address given to me by someone, but that's it. I posted a mail to him, but no reply. I even went so far as to call the 800 number that the book mentioned, but the person who answered has no idea what we're talking about. Rich Tietjens and I tried, but this guy was pretty rude. Since I'm deaf, I use my state's TTY relay service, and the two times I tried, he hung up on the relay operator before the operator could get anything out. That's rude, all right. Rich had a somewhat better experience, but from what he said, the guy had a rather thick accent or something, and he couldn't understand much.

Some of us out there still use MWC to do some programming. Some of us out there have gone on to using Lattice C or others. There's MiNT, which contains gcc, which is a C programming language in itself. My homepage has a link to the MiNT programmer and other pages from other people in this newsgroup also have links to MiNT and other things like this. I know Guy Harrison and a couple others on here, besides me, use it for some programming. I currently am doing some programming with it as well. Right now, as far as I know, the only C package that's still being updated and sold, is Lattice C, being sold by Toad Computers, version 5.6.

You may have also come across some old versions of C for the STs, like Megamax Laser C. I did not long ago, and found it was K&R C, not ANSI C, but it's great to have around to show what it was like before, when C was still being standardized. MWC used ANSI C. I can't list everything out there in the programming section, but you get the idea.

There was a bit of discussion on C programming with MWC awhile ago on here, so if you can, search back on the posts on here, or use DejaNews and/or other Usenet search engines.

: Any help would be appreciated. I haven't done any programming
: for years and it's like starting all over again with a new Atari.

Yep. Sometimes you have to start over again. What programming languages did you use? I've done some in Basic, Cobol, some Pascal, and a little assembler, and am starting out in C, but am doing nicely.

Sorry so long, everyone, but I had to repost most everything in this one message. If I tried reposting everything posted, it would have been an exceptionally long message!

For the past 3 years I've been working on the *definitive* Empire-style strategy game in hi-res. Features include up to 6 participants, fairly intelligent computer opposition, extensive, but not cumbersome, logistics handling, about 25 different kinds of units and a cooperative interface.
I'm using GFA Basic 3.6, and at this moment I'm extending the code to provide the possibility of one of the players playing via a modem.
The program is fairly stable, containing just one more annoying bug that can crash it, and some superficial ones. It still doesn't wanna compile tho (any hints welcome on that one).

Hi all,

For a small GEM utility I'm writing, I want to add some extra functionality compared to what standard GEM offers. I'm trying to get the program to push the top window to the back, if you click on it's move bar with the right mouse button. The easiest way to do that would be to access the list that GEM, I assume, holds of the windows and their respective depth, and change that. So basically I need to do the opposite of topping a window. Can anyone confirm that GEM indeed maintains such a list and tell me how to find/access it ?

I am trying to build a vt100 interface into Kermit. I am fixing and
expanding some *C* source from an old PD program, t100, that is on
umich. So far I have gotten most to work, except blinking chars and
scrolling. The t100 had four fonts, roman, underline, bold and reverse,
that it flips in and out with an a-line type command. These fonts are
in a text file that gets compiled along with the rest of the program.
Can anyone give me some help on how to implement these commands?
I am using Lattice C, 5.6. I also need to put in a font that has the
"real" graphics chars for VT100, rather than the non-standard vt52
stuff that Atari uses. The program has to be able to run on any ST, TT,

etc.

I'm working on a Usenet newsreader program that works with STiK.
Its called NEWSie, and its currently under development, with some
outside testing going on.

If you see this message, then the posting facility in NEWSie is
probably working (at least partially).

Ah, a new one. Well, that's reasonable for brand new (though I didn't know Toad still had any new STes in stock). However, they are hardly the only place left:

Blink is not a supported attribute under TOS, so in order to blink a
character, you have to keep track of where it is and constantly
erase/redraw it (or change the color to background/foreground, which
amounts to the same thing).

Creating a font is fairly easy, but unless you want to reinvent the wheel
for some reason, you'll probably be able to find a suitable font already
compiled - you could just inline the code. The font that comes with ANSIST

is quite nice, and you may even be able to get in touch with the author
(I'm not at home so I can't look him up) to get permission to use it.

Hi there!

I wish to edit resource files to give them my own personal touch (won't
say which, the authors will get upset :). I'm using either WERCS or ORCS.
I wish to change an icon in a dialogue box. I have designed my own icon
in mono .IMG format and imported it into the ORCS icon editor. After
saving the resource file, the program to which the resource belongs now
doesn't run correctly when I access the particular dialogue I changed.
What have I done wrong!!??!!

TIA for your help...

Chris W.

Resource editors may change the number/order of objects in object trees
as you edit them, this means the program may address the wrong objects,
maybe expecting properties that aren't there. This causes unexpected
behavior or even crashes.
I had this problems also when trying to 'translate' programs by editing
the resource files. So I wrote my own resource editor to do just this,
that guaranteed that the object numbers/properties did not change.

You can create them yourself from suitable documentation. It is easy
to add TOS functions. You may remember that these were simply macros

for gemdos(), bios() and xbios().

Similarly, Gem functions can be added. Although easier if you posess the library source code (where you add them directly), it is perfectly possible with a little assembler knowledge to write your own self contained bindings for the newer calls and add them into your object library.

> Also the .RSC file for MWC only will allow the older screen
> resolutions, can any of this be brought up to date??

No (below) but provided the resource editor will actually run then you will be able to create resources compatible with the Falcon.

>Is MWC still supported?

No, they went bust.

Sure, GEM maintains such a list. However, the list's position and it's
structure are no documented features of the AES, so it's not appropriate
to mess around with it if you find it. This is for very good reason.
Other window managers like the one in MagiC have the list at a different
location and even use it in a different way. So please get rid of this
idea.

Newer TOS versions provide a wind_set() subfunction WF_BOTTOM, used
exactly like WF_TOP, that bottoms the referenced window.

Cheers Peter

As soon as you load the resource, save it with the option to write a header turned on. Copy the header somewhere. After you've finished fiddling, save again and compare the new header against the old. If any of the values have changed, you're buggered. Actually no - the program will be!

Try it again but this time just edit the existing icon. Provided you do not perform an action that results in the editor re-ordering the object tree it will work.

I don't think they're renowned for low prices. I mean, they have 1050

(Atari 8-bit) disk drives for sale for $99, and that's an item I've been
able to find in thrift stores for about $10, including a power supply and
data cable. :)

Hi,

There is actually possible to do excactly what yuu are describing with
the AES, however it's only available as of AES v4.0 (or later). You can
then send a window to the bottom by using wind_set() with mode set to 25
(WF_BOTTOMED). You receive a WM_BOTTOMED message when the user
shift-clicks on the window's mover bar.

MagiC also has support for placing windows at the bottom of the window list.

Maybe it's a bad idea to include your "extra" function as it is supported
by both MultiTOS and MagiC. If you decide to include it anyway, please
make sure neither of these systems (or any other that supports these
calls) are installed.

Take care,

!! Web Page update !!

Matrixx' Hellish Web Page

http://www.ior.com/~danbrown/

--> NOW LYNX FRIENDLY
    Sorry guys. I thought that it was already! But i didn't actually
    check it with Lynx til a few days ago. Anyways, fixed now!

--> [LINKS] TV & Shows
    Fixed/scaled the pictures. Now they should look right with all
    browsers!

--> [LINKS] MISC
    Expanded the list. Now includes links to help you build a
    web page! Will get the images in there for 'em soon hopefully.

--> [LINKS] Search Engines
    Scaled Images

--> [LINKS] Atari - General
    Added some images for the graphical end.

--> [LINKS] Atari - Jaguar
    Expanded the list. And added images

--> [LINKS] Atari - Companies
    Expanded the list. Fixed/created images

--> [LINKS] Atari - Support
    Expanded the list. Added images

-* All the pictures are now scaled. So my web page should now look

-* right with all graphical browsers! I didn't realize that Mosaic
-* (atleast the vers my friend uses sometimes) didn't support
-* HEIGHT/WIDTH variables! oops :)

-* I've been working on this web page for about a month and a half
-* now. I'm still VERY new to html! If you have any hints/tips etc
-* I'd love to hear them! :)

THANKS to EVERYONE who's given my web page a chance!

Hey! what is this? How come that I have not heard of this?

Is your News-reader an Off-line or On-line newsreader.

I ask because that I and Mark Baker are working on a Off-line Newsreader.
It will be 2 programs! Babel that does the collecting, sending, maintenace
of the messages, and FireNews, which is the reader. Please tell me more
about your project (in e-mail please) so that I can inform the STiK group
about this.

: To start the ball rolling I am working on a full screen 3d maze game.

I'm currently putting the finishing touches on a Top Ten program for the Transcendence BBS program, now that it works real good. I'm using an old copy of Mark Williams C, released around 1988, as many of you know from previous posts about it. I spent 3 weeks working on it, getting some help and so on, while getting to learn it. I've touched on some topics that I've wanted to learn, like file accesses, structures, arrays, and that sort of thing. Now that I bought a used copy of Lattice C 5.52, I'll probably recompile it under that, to make it run a little faster.

All I need to know how is who else on here runs Transcendence. If I get enough requests, I'll post it on here. Total size of the archive shouldn't be more than 15K, since the actual program is about 12K. Small sucker. It's pretty much bulletproof after some abuse and testing. I'll create an area on my webpage for downloading the updates later on.

: Also I am putting some C++ classes together for an X-File-y text adventure
: which with some STOS sections e.g. animations passing parameters via the
: command line.

Lots of books out there to help. Some of the best references I've found aren't exactly for the ST, but rather, written for Borland and Turbo C packages, but they do help quite a bit!

I'm using AHDI. Maybe it's MINIT.TTP that don't like external SCSI drive
partitions of that size (210 MB) ? The format seems to succeed, now with
the TAF package ... but the next step, that is making the directories with
mkdir, fails as I described in a previous posting today. I get an error
message something like, "mkdir, can't create directory /usr : error". If
I try executing mkdir directly in the shell, as opposed to from the installation
script, it also fails.

/Mikael

The 'P' tries to protect the Minix files system from 'TOS' accesses.

Even so, I once had my Minix partition trashed by a program that wrote directly
to the disk, & assumed it was a TOS filesystem.

I also saw problems with creating files, 'permission denied', there seens
to be a limit to the number of files/folders in the root of a partition.

Has your partition got >127 files/directories ?
Who is the owner ?

Maybe (this is a guess) the problem is with your shell, can it handle '/' ?

I tried the TAF package yesterday. I ran the setup144 script with argument
h, which means install it on drive h. H is a 210 MB partition on an external
SCSI drive (1 GB Conner) on my C-lab Falc. The creation of the file system
seems to succeed (it reports ok) but when the script continues and tries to
"mkdir /usr" it failes. Why ? I looked at the script and the file system is
created with /c/minit.ttp -V -P -n 4 h.
What does -P do ? According to minit -h, it writes some kind of null file
system. Is that the way it should be done ? Maybe some access rights should
be set for the whole file system as it is created ? If I force a
continuation, I get errors when the directories and files are trying to be
written so it seems to be some access rights or so. What to do ?

/Mikael

I am trying to find out how to bring a task to the foreground under AES 4
and compatibles.

This can be done by selecting the application under the Desk menu, but I would
like to write software capable of bringing an application to the foreground
itself.

I have been partially successful by sending a WM_TOPPED message for one of the
application's windows, but this method fails when an application does not have
any windows open.

I would also like to be able to determine which application is currently in the
foreground. Currently, I am using menu_bar to check what menu bar is on top,
and checking the owner of the top window. This method fails, however, when
the application does not have a menu bar or any windows.

Any suggestions on either of these issues would be appreciated.

time zones) who is familiar with Lattice C, ver 5.6, esp. with
their makefiles? I am trying to recompile the latest version of
Kermit and add some much needed expansions. I have e-mailed HiSoft,
who still sell LC, but don't support it anymore. The program is LARGE with
more than 20 modules, so a makefile seems the only way to go. BUT, I
can't get it to link right.

If there is someone with whom I can correspond, or even phone
about this, I would appreciate it greatly. The program compiles and runs
under MWC, but not lattice. I need Lattice, because I can get an
alarm function with it.

reply-to: guy@swampdog.demon.co.uk
newsgroups: comp.sys.atari.programmer
organisation: SwampDog

I've spent all afternoon trying to deal with conflicting information.
All I want, is to write MWC bindings for form_xdial() and form_xdo()!

MagiC 2 manual sez ...

form_xdial(int flag, sx,sy,sw,sh, bx,by,bw,bh; void **flydial)

```
control[0]    51
control[1]    9
control[2]    1
control[3]    2 <- ?
control[4]    0

intin[0] flag
intin[1..8]   sx..bh
```

```
addrin[0] flydial
addrin[1] 0 <- why ?
```

Now, two of my other manuals say *standard* form_dial() control[3] is *ordinarily* 0, yet when I look in the MWC code its got control[3] as 1 for a standard call. As the MagiC manual blithers on about one extra parameter I'm totally confused. Tried just about all combinations I can think of - the best I've managed is to pass flydial as NULL which comes up with no dog ear. If I attempt to pass non NULL it comes back unchanged and is either still ignored or form_xdo() bombs. I even tried *flydial = addr_out[0] type stuff as well just in case. Nowt!

Now onto form_xdo(). Is this binding correct? ...

```
int form_xdo(int tree, startob, *lastcur; XDO_INF *tabs; void flydial)

control[0]    50
control[1]    1
control[2]    2
control[3]    3
control[4]    0

intin[0]  startob

addrin[0] tree
addrin[1] tabs
addrin[2] flydial

intout[1] lastcur
```

Like I said, the dog ear never appears (when it's not crashing) but lastcur is being returned correctly, so I at least know its making the MagiC call - I was even beginning to wonder about that at one stage!

Btw, I've implemented form_xerr() and form_popup() with no trouble at all.

!Help!

A lot of our people only have access through one or another of the
Freenet systems. There is NO ftp access with a Freenet! Gopher, Lynx and
E-Mail only and most of the Gophers don't know an .lzh file from a .txt
file. Same goes for the self extracting tos archives that appear from
time to time!

> 2. Everything that gets put on a binary newsgroup has to be archived

Does give you a reason to check frequently!

> >: These days it is _much_ better to upload software to a web or ftp
> >: site and post an _announcement_ on one of the news groups!
I agree, but again not everyone can get to ftp sites, so a web site is
better, or umich which can be accessed either way, if you can get in to
ftp it there in the first place!

> >But it is not free, why should IBM users get all the free bandwidth they
> >want and Atari users with none?
With the Internet voice phone and live video for the PC's, I think the
bandwith argument is moot!

2.6.1 have some serious bug (I don't remeber what now). There is also
available 2.6.3. try:
atari.archive.umich.edu
ftp.cnam.fr (currently down :(
or some of the greman sites (ftp.uni-paderborn.de, ftp.uni-kl.de ...)

It has to be somewhere, because I've got it from the net for more then a
year.

Szymon.

One thing at a time -- we have 9 years of Antics & STarts to scan. That
will keep us busy. I'll eventually try to get permission to put ANALOG
online, too.

There are ftp-by-email servers available. Sure, it's slower than ftp,
but you get what you pay for.

>With the Internet voice phone and live video for the PC's, I think the
>bandwith argument is moot!

You mean, you get all the bandwidth you want for free, so other
people's worries don't matter?

>> The huge number of IBM users makes distribution via Usenet a lot more

>Heck, they can go into a store and buy all the software they want! 8^) We
>are rather limited in that respect!

The technical point is that, for IBM software, distribution via Usenet
uses less resources than distribution via ftp. For Atari software,
it's the other way around.

  news.announce.newgroups soon. It is being posted to the comp.sys.atari
  groups for feedback before the final submission to David C. Lawrence,
  the news.announce.newgroups moderator. Please give us your thoughts on
  this proposal. Thank you. --KRH]

REQUEST FOR DISCUSSION (RFD)
moderated group comp.binaries.atari
unmoderated group comp.binaries.atari.discuss

Newsgroup line:
comp.binaries.atari   Binaries for Atari computers. (Moderated)
comp.binaries.atari.discuss Discussion of content of c.b.a.

Proponent: Rich Tietjens <starship@3rdplanet.com>
Proponent: Kyle R. Hofmann <rhofmann@crl.com>
Proponent: Adam B. Roach <adam.roach@exu.ericsson.se>

This is a formal Request For Discussion (RFD) for the creation of
world-wide moderated Usenet newsgroup comp.binaries.atari, and
unmoderated comp.binaries.atari.discuss. This is not a Call for
Votes (CFV); you cannot vote at this time. Procedural details
are below.

RATIONALE: comp.binaries.atari

Currently, there exists no appropriate and easily accessible medium for the release of Atari software. There is also a growing pool of software available for these machines which would recieve a marginal distribution at best due to this lack of a medium. Though FTP sites and several binaries newsgroups (alt.binaries.comp.atari8bit and alt.binaries.atari) exist, many Atarians do not have FTP access and the alt groups have a poor distribution.

By creating comp.binaries.atari, a medium would be established. comp.binaries.atari would provide a method of distribution. With c.b.a, the immediate dissemination of new releases and bug fixes would be possible.

This method also has the advantages of using comparatively fewer system resources than other methods, and of keeping binaries out of existing comp.sys.atari.* discussion groups.

END RATIONALE.

RATIONALE: comp.binaries.atari.discuss

The existence of a .discuss group allows the discussion of the binaries groups to stay separate from the actual binaries postings and from non-binary related postings. Without a discussion group, non binary posts related to the topic of the binaries heirarchy have no single place in which they can be discussed; instead, they are spread around a heirarchy of newsgroups, making worthwhile discussion difficult, if not impossible. This discussion group will create a proper place for discussion and comments on binary software posted in the comp.binaries.atari.* heirarchy.

END RATIONALE.

CHARTER: comp.binaries.atari

For the distribution of Atari compatible or Atari related software. This includes bugfixes, updates, and new releases to Atari computer software and software on other platforms related to Atari computers (such as emulators, disk image maintainers, and Atari to PC communication software). Software that has been posted within the last 60 days will be rejected; no reposts will be made within that time period. Non-binary or non-software submissions will be rejected.

The moderator will cancel any post which has been posted with a forged approval header.

Specific examples of allowed software include:

- Freely distributable software

- Revisions of previously released software
- Bugfixes of previously released software
- Commercial software with the explicit permission of the copyright holder

Specific examples of disallowed software include:

- Pictures, music, and other non-software binaries
- Recently posted software (posted within the last 60 days)
- "WaReZ", pirate software posted illegally without the copyright holder's permission
- Discussion of software posted to comp.binaries.atari
- Requests for software
- Reposts of software previously posted

END CHARTER.

CHARTER: comp.binaries.atari.discuss

This group is for the discussion of binaries posted to the group comp.binaries.atari. On topic posts include:

- Asking for alternate methods of distribution for a binary
- Discussion of the relative merits of a particular binary in comparison to competing packages
- Requests for a piece of software which has not been posted recently
- Requests for a piece of software which was incomplete to be mailed

Binaries, spams, MAKE.MONEY.FAST schemes, computer advocacy, and discussion not pertaining to the comp.binaries.atari groups is considered off topic.

END CHARTER.

MODERATOR INFO: comp.binaries.atari

Moderator: starship@3rdplanet.com (Rich Tietjens)
Backup moderator: rhofmann@crl.com (Kyle R. Hofmann)
Submission address: starship@3rdplanet.com

The moderator is author of a number of freeware packages for the TOS compatibles, active in the various Atari discussion groups, several fido-technology networks, and is employed in the networking industry.

END MODERATOR INFO.

PROCEDURE:

The discussion period lasts 21 days from the initial post of this RFD. If there are no major objections to the naming or placement, then the CFV (Call For Votes) will be issued, lasting for at least 22 days. Following the vote, there is a 5 day

discussion period after which newsgroups that passed will be
newgrouped by the moderator of news.announce.newgroups.

Followups to this post are directed to news.groups, which is where
further discussion will take place. Cross-posted followups are
discouraged. Please read news.groups to participate. Thank you!

DISTRIBUTION:

This RFD has been crossposted to:

Just curious. Do you have an example of this?

Thanks,
Tom.

does somebody have an idea why GFA-Basic V.3.6TT produces an error when
more than 1000 string variables are filled:

```
index=0
DO
  a$="anything"
  add index,1
LOOP
```

GFA crashes when index more than 1000.

thank you for your answer

Be nice now! You might try to get something from the a.a.u.e archive via
e-mail before you jump on me! It no longer works! Seem since "everyone has
ftp access" a lot of the ftp mail bots have been taken down! I had a copy
of that really long text file describing how to get "anything on the
internet" via e-mail, bu tit seems slightly out of date!

  Excuse my ignorence in this matter, but I do have what I feel to be
a valid question,
  If people are apposed to the ATARI binaries group, then why don't
they simply not subscribe to it?,
  Surely this is less time consuming than moaning,

  There are a lot of binaries groups I don't like, in fact the names
of some of them make me sick, so I simply don't subscribe to them,
it's a great plan and works really well,

This is precisely what my MagiC docs say as well. I guess addrin[1] is reserved, like with many other functions, and this is consistent with passing control[3] = two parameters.

> Now, two of my other manuals say *standard* form_dial() control[3] is
> *ordinarily* 0, yet when I look in the MWC code its got control[3] as

This is alright, since form_dial does not take any pointer parameters.

> 1 for a standard call. As the MagiC manual blithers on about one extra
> parameter I'm totally confused. Tried just about all combinations I

Why ? MWC obviously passed one parameter to many, this would hardly get noticed by AES.

> can think of - the best I've managed is to pass flydial as NULL which
> comes up with no dog ear. If I attempt to pass non NULL it comes back

Like it should do according to the docs.

> unchanged and is either still ignored or form_xdo() bombs. I even
> tried *flydial = addr_out[0] type stuff as well just in case. Nowt!

Dunno. Haven't tried that one.

Exactly like my docs are stating !

```
> Like I said, the dog ear never appears (when it's not crashing) but
> lastcur is being returned correctly, so I at least know its making the

***** Press Release *****

August, 1996

Subject:

***** OMEn becomes OASES, and Goes Multi-Media *****

* In Brief
* System name
* Macintosh/Power Mac Version
* Other Versions
* Movies
* Interactive Textbook, the Multi-Media Literature System
* Download Oases
* Prices
* Availability

* In Brief

Many exciting developments have been taking place at EDLI, and it's about time we told you what they are! We've made the operating system more available and changed the name. Of course, we have been continually improving it, and it's got some features that even Mac and Windows don't have.

The App-Launch program and directory "bookmarks", plus the ability to play a sound or view a picture simply by clicking on the file, help users navigate and find things easily, and behind the scenes, new calls such as picture (RLE) encode-decode provide good support for new items such as movies and shrinking large picture files.

And, at last, we have some software of value to end users as well as to programmers: a means to create your own multi-media literature materials. If our plan for helping people to distribute their creations works out, you may even be able to make money writing such materials.

Everything is on-line (or about to go on line) at our web site (URL at top): the Oases system itself; programming manuals and Eazy-Asm assembler; the premiere edition of Interactive Author, the multimedia literature creation software; and more.

* System name

The OMEn (Open Multitasking ENvironment) operating system has been renamed Oases Open Software Environment (how about "Open Architecture Software Environment System", if you're hooked on acronyms). This is expected to make the system more appealing to many English speaking users, as "OMEn" always seemed to have a little black cloud over it in spite of many attempts to ward it off!

* Macintosh/Power Mac version

The Macintosh version of Oases is on sale. It runs on all tested models from Mac-512KE through Power PC 6100/60. The Macintosh version runs exactly the same software as the Atari version, except for a couple of very machine-specific programs like the Atari-ST VIDI-Recorder. The display, too, looks virtually identical to other versions. Oases for Mac will make use of any mounted Macintosh volume, including file servers and CDs. Currently Supported displays are monochrome, 256 colour and 32768 colour ("Thousands" setting).

* Other Versions

The PC porting is currently on hold owing to the range of other committments, but will certainly be completed at the earliest possible date, hopefully by the end of the year. We expect the current range of products to generate interest in a joint venture for completeing the PC and other portings.

We are planning a joint venture with another company to create an inexpensive single-board OASES "embedded control" computer based on MCF5202, Motorola's new 68000 compatible RISC processor. Becasuse Oases runs the same software on any machine, users would be able to test their software on their Atari/Mac/PC before trying it in the controller (except hardware dependent sections, of course!). This system may later be made available in a general "PC" configuration as well. Speed should be similar to the better 68EC040 systems.

* Movies

We've come out with a simple spec to define Oases movies containing animated graphics, still-picture "slides", and sound. Movies are played in the Interactive Textbook program, and other software can easily be written to play movies. The movie spec allows creation of movies and slideshows from any source of pictures and sounds.

And, we've taken a VIDI-ST video digitizer for Ataris and made the Atari-ST VIDI-Recorder program to create Oases movie animation sequences with 8 different video frame rates and sizes in four or sixteen levels of gray, with aspect ratios for most "normal" displays plus two for "ST-Medium-Rez" mode, with its tall pixels. A 2.5 or four megabyte ST or STE is demanded. The lowest frame rates and small sized pictures give over a minute of recording time on a 4 megabtye machine.

The Picture-Condenser utility program helps to trim down movies with larger pictures so they can better fit on a floppy disk. (Oases 3.38 and above automatically un-condense pictures for display.)

* Interactive Author and Interactive Textbook

These are our "star" programs. The premiere version of Interactive Author is now available on our web site (URL on letterhead). It allows its user to create and use multimedia "interactive textbook" literature on any conceivable topic, for reference works or educational curriculum.

The "pages" of the "textbooks" may contain text, pictures, sounds, slide-shows and movie clips. Page-link buttons dynamically link pages,

similar to hypertext.

And, as if that wasn't enough, "evaluation" items add the ability to use Interactive Textbooks for self-paced studies and distance education: all the teacher has to do is sit the student down at the computer. The student cannot proceed through the book without correctly answering the evaluation questions, and so when he/she returns having completed the "textbook", the teacher will know the material in it has been mastered.

We hope to compile a catalog of interactive textbook multimedia literature developed by other authors, and to offer distribution with commissions/royalties for well-written, original-material-only works.

Free Interactive Textbooks are also available for download on the web site... including "Using Interactive Author", whitch contains instructions for creating your own Multi-media literature.

* Download Oases

The Oases system is "protected" by having a colour coded software licence. It may, however, be run without the licence, and is available at our world wide web site: http://www.oases.com/~omen

Without the licence, it is possible to save only small files, and not large ones, to disk. But, it is entirely possible to use it, and to run Interactive Textbooks created by other users. Distribution copies will run as licenced until the end of the month they were released: i.e, OASES338 will save any files until the end of July.

* Prices

Oases system licences, printed software development manuals and software developer registration are the only items for which EDLI currently charges: The premiere edition of Interactive Author and all our other items are free, or available on disk for shipping & handling charges.

Oases-for-Macintosh costs $69.95 Canadian. Oases-for-Atari is $44.95; or both licences for $99.95. (approx. US$ equivalents: $52.95, $33.95, and $74.95) Order by August 15th and get 25% off any above item. Order Interactive-Author Professional Edition for the special pre-release price of $69.95 Cdn/$52.95 US, with delivery late fall or early winter '96.

* Availability

Oases products are available from:

EDLI (Contact information at the top)

In the UK, Oases is also carried by:

Floppyshop
P.O. Box 273
Aberdeen, Scotland

I've heard of this problem before. I use 3.5e on my Falcon so I can't verify this, but I've heard that it has to do with GFA handling the strings as integer variables (I think it builds some sort of array to house them in, then assigns them some sort of number). Anyway, it is a bug in the interpreter. Try compiling the program and see if it still crashes. If it does, you'll be out of luck. GFA 3.6TT is VERY buggy, that's why I didn't upgrade. I sacrificed the interpreter running in high resolution for error-free code.

: unmoderated group comp.binaries.atari.discuss

Is it possible to just use comp.sys.atari.st to discuss stuff in comp.binaries.atari? Why create comp.binaries.atari.discuss? I know I won't go looking for something in c.b.a. unless I read about it in c.s.a.st as I don't intend to poke my nose in there if I can help it. Also, does it have to be moderated? Seems like that was the cause of problems before. And then, of course, comes the issue of: do we really need this. Right now I'd say we do, primarily because there is no satisfactory ftp site. I wish we could set up a really nice network of ftp sites (one in US, one in UK, one in Germany, France, etc...) that all mirrored the complete archive. U-Mich used to do this, but seems to have gone all rough around the edges.

As it stands, there currently is no repository that I am aware of that
supports pictures or music files. I collected the 8-bit Atari .MOD
music files, and would like to be able to trade and/or collect more
titles. As far as I know, there are no copyright restrictions on the
MOD and related music files because they were generally released
anonymously.

A blanket prohibition on all music files to be overly restrictive.
The music and picture files specific to the Atari 8-bit computers are
small, hard to find, and tradeable. I would like to see them allowed.
This request does not extend to .jpeg, .gif or other modern formats,
nor to material that is already prohibitted from the Internet.

Please modify the proposal to allow music and picture files specific
to the Atari 8-bit computer to be posted.

I am trying to write a vt100 front end for Kermit, and know less *C*
than I should. The only things I can find in the Lattice C manual use
one char at a time i/o. In the files from HSMODa07, he talks about an
fcntl() function that does buffered i/o. Is that available only under
mint? I have gotten the extended Lattice libs from Hensa, and there
seems to be an fcntl in it. Can someone help a poor novice with some
help how to use it? One char at a time seems dumb.

GFA Basic has problems with freeing the memory used by redundant strings.
The answer is to make regular use of:

~FRE(0)

wherever possible, especially in loops. This forces a garbage collection
to occur.

You need to specify what kind of Atari software is going to be on here
(8-bit, ST, TT, Falcon, whatever). Seems one user seems to think this is
for ST stuff. I'm not even sure what format this is going to be for, myself.

And if this is for 8-bit, there's already an 8-bit binaries group that
doesn't get wide distribution.

I completely agree. I remember having an extensive collection of Atari
art and certainly would like to see all that be back in circulation.
There were BBS's with literally hundreds of original art and musical
items. Where are they now?

No need for an FPU when you have a DSP chip built into the atari falcon :)
As far as I understand, that enables the falcon to play .mp2 files in real
time, and it sounds great too :)

>>So, I'm adding my favorite group of programmers to the distribution list on

I doubt there will be one for the STe/TT, but one does exist for the falcon
(look for mp2ad.lzh) on the popular ftp sites.

This may be off the mark ... but if you are talking about stdio
functions like fputc() etc then don't worry because they are buffered.
Tos functions on the other hand (like Cconout(), Bconout()) are not

buffered.

That is an understatement. The whole point of the new binary group would
be to give it wider distribution. Very few of the ISPs in my area, and
none of the universities I've heard of accept alt.binary- anything.

I expect the new binary group to allow both 8-bit and ST stuff, although
I am only interested in the 8-bit.

Actually, way back when I just started doing the internet thing, I had (and
still have,) a Freenet account. Soon after I discovered the ftpmail
servers, National Capital Freenet (Ottawa, Canada) policy changed and I
got the proverbial 'slap on the wrist' for using ftp-by-mail. This _may_
not always be a resource of last resort.

In order for the RFD to stand any chance whatsoever of passing, a comp.binaries group must be moderated. This is one of those unwritten laws one hears so much about. <G> For those who prefer an unmoderated venue, alt.binaries.atari has been newgrouped (several times) and, while distribution is spotty, is available from many sites. I can personally assure you that the moderation this time 'round will be responsive and active.

The discussion group, while not strictly necessary, (of course, the whole Internet is "not strictly necessary") will help to segregate the "why didn't my cracked copy of Lemmings get posted?" from "who has a good routine to read the system clock?" and thus relieve clutter in c.s.a.* (at least, that's the plan).

As for ftp sites, all I can say is, "wait until next year."

Hmmm, as long as we still prohibit MOD files (which do have an appropriate
venue for distirbution), I think we might consider Atari-specific files.
Technically, the "chip music" files for both the 8-bit and ST series
probably could be considered binaries in that they are obviously not
graphics nor text, and they aren't useful on any other platform.

8-bit graphics files are so tiny (<=8K as I recall) that I don't have a
problem with that, either. ST-resolution graphics would have to be pretty
special to qualify, though; 32k isn't huge but it's big enough to be a
nuisance if a lot of them are posted, and frankly, while I love the
systems, I am underwhelmed with most of the graphics that have been
produced for it. This is a case where I think http distribution does make
more sense.

Kyle, your opinion, please?

That did cross my mind but I couldn't be sure not having accessed Gem
at this level very often.

With the MagiC docs stating that form_xdial() and form_xdo() would
behave like form_dial() and form_do() under normal Gem, and there
being 2 addrin[] parameters for one additional pointer, it could have
been that form_do() took a hidden addrin[0] of NULL. Equally, just
like you say, and most likely, the MWC binding could be buggy.

>> can think of - the best I've managed is to pass flydial as NULL which

>
>Dunno. Haven't tried that one.

If you get a few moments I would be grateful if you could try it.
Sticking to the documentation ...

```
char *flydial;
form_xdial(FMD_START, ... , &flydial)
```

form_xdo() works as per docs if flydial=NULL on entry to the above.
Naturally it is NULL on exit and gets passed to xdo() as NULL. No
problem - no dog ear.

With flydial passed as non NULL (I tried -1 and 1) flydial comes out
looking like a healthy pointer but xdo() almost always causes MagiC to
barf. I tried swapping the xdo() tabs and flydial args just in case.

That's as far as I've got! The only idea I've got left is to tie up
all the system memory just before xdial() and see if flydial comes out
as NULL. If it does, it would seem to indicate the problem lies in
xdo(), otherwise xdial() ?

>> Now onto form_xdo(). Is this binding correct? ...

[snip]

>Exactly like my docs are stating !

Darn again!

> Surely this is less time consuming than moaning,

I'm not sure that people *are* Opposed to a binaries group for Atari:
indeed, ever since this matter was first raised, I have kept on plugging
along with the concept of resurrecting the (it would seem) prematurely
rmgrouped moderated group, that died for one of two reasons (1) no one
was submitting anything, so the moderator decided that the group was no
longer needed, or (2) the moderator was a lazy git who arbitrarily chose
to ignore everyone's contributions. Having the group in the
comp.binaries.* hierarchy would gain far better propagation than trying
to create a new group in the alt.binaries.* one.

The reason why there is opposition to the concept of adding *any* new
binaries group is nothing to do with whether or not an end user chooses to
subscribe or not: what end users do matters not one whit to the fact that
the group would have to be propagated around the globe to all the servers
that host news (just in case an end user that *did* want to subscribe was
hosted upon that server); Brian Reid seems to have stopped producing these
statistics, but about a year ago his figures suggested that there were
380,000 servers around the world. For *any* group to be truly viable, it
helps if its traffic gets to every single one of these (some, of course,
are too small, or limited in bandwidth, and it is these that choose not
to take binaries hierarchies).

Rest assured that folks have nothing against Atari users as a breed: it's the principle of adding additional binaries groups that is the sticking point.

> There are a lot of binaries groups I don't like, in fact the names
> of some of them make me sick, so I simply don't subscribe to them,
> it's a great plan and works really well,

The argument that "group x.y.z exists, so why cannot a.b.c" will never hold water, I'm afraid. In fact, it's one of the best ways to ensure that your proposal is treated with derision.

(Maffia wants 8-bit sound and graphics files allowed in proposed
comp.sys.atari.binaries. Tietjens says maybe ok or something.)
I'm opposed to sound files and picture files, but really don't
care. I could see the binaries group get a bunch of tiny

picture and sound files. Hmmmm... I go to the midi binaries
group sometimes, it is a mish-mash of requests and binaries.
Sorta a prototype for the proposed atari. binaries. Except
Tietjens and Hofmann are looking for more 'discipline'
. Maffia wants to trade these rather rare formats of
sound and picture files. He probably has more of them
than anyone else, he's a rare bird that likes that type
of stuff. A simple post in csa8 might find out for him
if there's anybody else that likes the same type of
stuff. I like the original idea to exclude picture
and sound binaries, just have program files.

I heard there should be an older version of gcc out there
somewhere, that executes on single TOS. Does it support
code generation for the DSP56k or does it produce just
plain old 68k code ? Where can I find that version of gcc ?

Also, when Atari was about to launch the Falcon they had a
folder that described all sorts of sofware that were under
development. Many of them are out now ... except for a very
interesting package that was some sort of high level object
oriented programming language for the DSP56k. Is anyone
familiar with this ? Has anything like this been released ?

[It would be nice to program the DSP56k without sticking to
  assembler...]

Greetings,
I do not have an Atari computer, but I am considering buying one (mainly for programming purposes), I have read everywhere that in low-resolution the max colors that can appear on screen is 16? But I also heard that you can get the full color palette on screen also, how is this done exactly? Is it possible? What are the limitations of this technique?

I would mainly like to be able to display 64 colors on screen. I guess that if you can display 4096, you can also display 64, no?

P.S: I am talking about the Atari STe line of computers.
Thanks in advance for your information.

That's correct; except through the use of programming tricks. By switching the palette every scan line (or, as Spectrum 512 does, 3 times each scan line), you can display the full palette in low-rez. This allows for a max of 48 colors per scan line; 48 x 200 = 4800 so in theory you could see all 4096 colors (I believe Spectrum 512 supports a lower number due to bandwidth restrictions, however). By screen flipping also, as many as 32k

colors have been displayed, but it flickers rather badly on my SC1224 -
'twould probably look good on a TV set.

: : unmoderated group comp.binaries.atari.discuss

: Is it possible to just use comp.sys.atari.st to discuss stuff in
: comp.binaries.atari? Why create comp.binaries.atari.discuss?

  Yes, it's possible, but not everything posted in c.b.a will be ST
related. It's better to be more general in this case and to create a
.discuss group to handle all traffic concerning c.b.a.

: I know I won't go looking for something in c.b.a. unless I read about it in

: c.s.a.st as I don't intend to poke my nose in there if I can help it.

  Hmm... It would possible to allow crossposting of part 0 of uuencoded files to other comp.sys.atari groups (part 0 is traditionally a text description, while parts 1 and up are the file itself). Is this a good idea? It may not be, especially if we get a lot of postings to c.b.a.

: Also, does it have to be moderated? Seems like that was the cause of
: problems before.

  Yes, it does. Nobody has tried to create a moderated comp.binaries groups since comp.binaries.apple2 a long time ago, and that was changed to moderated eventually. The proposal won't be accepted by the news.announce.newgroups moderator if it isn't moderated.

: And then, of course, comes the issue of: do we really
: need this.

  IMHO, yes.

: Right now I'd say we do, primarily because there is no satisfactory ftp
: site. I wish we could set up a really nice network of ftp sites (one
: in US, one in UK, one in Germany, France, etc...) that all mirrored the
: complete archive. U-Mich used to do this, but seems to have gone all
: rough around the edges.

  That would probably be a very good thing, but that would still exclude those who don't have FTP access. :(This way we can include them (as long as they have Usenet access) and not worry about having to set up FTP sites.

: more sense.

  I don't have a problem with 8 bit graphics files in terms of size, but
conceptually, I can't see a group meant for Atari binaries in general
excluding binaries for the ST simply because of their size. I don't
think it would be a problem, though, as 32k isn't all that big in
comparison to other things that are posted.

  I recieved e-mail concerning an issue similar to this from someone
recently, but it was more general. The issue was: What kinds of data
files are to be accepted? If you think about it, it's important if you
plan to moderate the group much more than "no WaReZ".

  To my knowledge, there isn't a proposal out there that has discussed
this issue much, mainly because all the comp.binaries groups that have
been proposed so far haven't tried to limit themselves much beyond what
platform they are for.

My response to this question is that we should probably post data files used in the operation of software. For example, if I draw a picture, it wouldn't be distributable on c.b.a because, after all, it's only a picture. If I create a character set for use with a word processor, though, then that would be distributable on c.b.a because it's used during the operation of the software. (I hope you're all not confused :) Does anyone else want to contribute? If you have a good idea, post it.

All of the above. Any Atari software is acceptable. If someone writes a Jaguar or Lynx emulator, that would be accepted too, along with titles. This is intended as a generic Atari software group, not as an 8bit or 16bit specific Atari binaries group.

Greetings,
Thank you for your response, but I would like to know, does this slow down the games and programs significantly, I assume it does, no? Would games still be feasible with 48 colors per scanline om an 8 Mhz 68000?

> The problem is very likely that you use 16 bit integers (don't you?).

I stopped using 16-bit integers a few years ago. My code is 90-95% 32-bit now - only Atari OS calls and some (very) ancient code remains 16-bit.

> I think most people do that on the Atari and that upsets Lattice's optimizer.

Perhaps I tried it on some old code that wasn't fully 32-bitted, and based my comment on that. (It was a typical blend of OS call, computation, data validation and so forth - pretty close to what I do in all my apps)

> I guess you mean all _global_ variables or it wouldn't have been possible
> to do recursion. GCC normally does the same, but there's a flag that I
> can't recall to make it use base relative globals instead.
> I never use that flag since it tends to cause slower code.

Yes. Silly me. Absolute local vars do't make sense.

Base relative globals allows one to use threading. Absolute data references from the code segment of the app are not fixed up when one forks a new thread. So all threads use the same data - a bad practice indeed.

I wouldn't mind slightly slower code if it meant better threading and smaller app size (relative code is generally smaller than absolute)

> I know MiNT can take advantage of such code, but I've never written any
> software for which it would've been useful.

Background threads are handy. One can fork a thread to do some background housekeeping for the app, and the main app just keeps chugging away at what needs to be done - without worrying about "housekeeping".

> I very seldom use Lattice C itself, but the manuals are almost always on
> my desk. The last release of them is almost unreadable, though.
> Someone must have set his word processor up incorrectly.

Bitch #32: THE MANUALS FOR 5.60 DO NOT LIE FLAT!

I use the 5.0 manuals, which were ring bond, and lie flat.

Bitch #33: VOLUME 2 IS ORGANISED BADLY.

I know that I am using a function correctly, but I need to find out which header it is in. v5.0 was organised alphabetically, so finding the funtion is easy. v5.6 is alphabetical within each header file, and then alphabetically by header file name. A one step look for function name becomes a two step find it in the index and then go to page X.

Bitch #34: LATTICE WILL NOT GENERATE 32-BIT OFFSETS FOR 020+ CPUs.

The compiler will not generate 32-bit offsets when compiling for '020 or better CPUs, when near-data is selected.

The assembler allows it, but "optimises" to 16 bit. A forced 32-bit offset will not get resolved by the linker correctly.

(I sometimes have large-ish data requirements that are needed in sub-threads under MiNT, and they overflow the 64k limit on near data addressing)

It slows down the system significantly - most of the CPU time is burned up in palette-switching. This is not a good chocie for games, unless it's a plain-text adventure that happens to have pictures also. It would be the worst possible choice for an "action" or "arcade" game.

Hi all,

Just out of interest - what projects are people working on??
To start the ball rolling I am working on a full screen 3d maze game.

Also I am putting some C++ classes together for an X-File-y text adventure which with some STOS sections e.g. animations passing parameters via the command line.
(Yes stos can use the commandline with a little 'helper' proggy!)

Take care
Davy

Switching palettes more than once per scanline does eat up CPU, but
switching only once doesn't. Many games use the technique of hooking a
palette change routine to the horizontal blank. Of course, you don't get
as many colours on the screen at once, but you can do some nice stuff.
Note that I've never done this, since I don't program in assembler...

I didn't realize until now that this question went to the Usenet.
(I received it by email as well.)

The following is an extract from a Usenet article that talks about this.
At other times I've seen full strcpy() functions, but this was all I could
find in my 'archives':

...
From: Lawrence Kirby <fred@genesis.demon.co.uk>
Newsgroups: comp.arch
Subject: Re: endian-ness
Date: Sat, 25 May 96 12:20:40 GMT
...

Except that you can test fairly efficiently whether at least one byte in a
word is zero. THe following C function shows an approach:

```
/* Assumes long is 32 bits but only the constants need change for different
   word (and indeed byte) sizes */

int has_zero_byte(unsigned long x)
{
    unsigned long tmp;

    tmp = x - 0x01010101;
    x = ~x;
    x &= tmp;
    return (x & 0x80808080) != 0;
}
```

I don't know if this is the best approach (best is in any event architecture

dependent) however it shows a method that uses 3 basic register only operations plus a test and a branch (in code that uses it) to check 4 bytes (more for wider words) for a null character. On most systems this will be faster than checking each byte individually. Real implemenatations use this sort of trick. Coupled a big endian archetecture this allows you you avoid byte operations on more than the first and last couple of bytes of the string.

>The Alpha has a special instruction (CMPBGE) to compare strings 8 bytes at a
>time, and return a bit vector of the results of the byte-wise comparison.
>This does at least allow you to find the terminator quickly, and copes equally
>well with big-endian and little-endian storage.

If you have direct and fast architecture support then there is no problem.
The problem is that not all architectures have such support and those that
do are not always flexible enough to be useful in all cases.

There are relatively new versions that do so.

>code generation for the DSP56k or does it produce just
>plain old 68k code ? Where can I find that version of gcc ?

A single GCC can only produce code for one family of processors.
You have to reconfigure and recompile it to target another.
Motorola have made available the files you need to build a 56k version
of GCC 1.40 (an _old_ version), so you can do that yourself.

Take a look at http://www.bdti.com/faq/32.htm for pointers.

I believe I've seen an Atari version of the 56k GCC, but that was a long
time ago. Try searching around the Web.

>interesting package that was some sort of high level object
>oriented programming language for the DSP56k. Is anyone
>familiar with this ? Has anything like this been released ?

I've not heard of anything like that, but you could build G++. ;-)

>[It would be nice to program the DSP56k without sticking to
> assembler...]

You'll still probably have to do the important things in assembler, since
even a very good C compiler like GCC won't come close to using a chip like
the 56001 well.

I've been off the Atari scene for quite a while, and was
wondering if there are and C++ compilers for the ST?

Anything along the lines of GCC or a commericial product.

K

There is a old version of GCC (can't remember wich one) working
without a multitasking OS.
It works on my F030, and I don't know if it could work if powered
by a 68000.

Fabrice.

better clarify before it gets too confused ... :-)

This the G_PROGDEF / G_USERDEF ob_type=24. ob_spec points to a USERBLK / APPLBLK / APPL_BLK structure which basically describes to the AES routines (supplied by you) which can draw and manipulate your custom object.

The "extended flags" are available for you to use in describing various non standard attributes of your custom object. They are not mandatory. You could just stick with SELECTABLE for instance.

For example, if you implemented your own form_do() routine, you may decide it would be nice to have a flashing attribute - you could then use one bit out of the extended flags ob_flags to represent FLASHABLE, and one out of extended flags ob_state to indicate FLASHING.

>(obviously - *recursion*) - you have to go and build an auxiliary stack
>to keep the data structures on which uglifies a nice simple algorithm.

I must be missing something - surely the addition of a local
declaration and a memcpy() will simulate it?

```
ansi(a)
WHATEVER a;
{
 ...
 ansi(a);
}

k&r(ap)
WHATEVER *ap;
{WHATEVER a;
 memcpy(&a,ap,sizeof(WHATEVER));

 ...
 k&r(&a);
}
```

>Of course nowadays passing lots of data on the stack is a *bad idea*.

True, but that was the days before decent memory allocation was
common to all systems. I remember a college Pascal which was strictly

implemented, it was therefore impossible to release dynamically
allocated memory!

Just for the hell of it one day, I got MWC to malloc() itself a new
stack each time it was nearly exhausted. Talk about non portable! :-)

>I'll leave it to the language lawyers to comment on op(wibble) vs

iirc, you are correct. op(wibble) was not legal but most compilers did
assume &wibble rather than barf.

Someone please correct me if I'm wrong here!

You can install Linux and use the whole GNU toolbox,
gcc, g++, gas, etc. but you currently need a 68030 to do so
which means you need a Falcon, TT, or bucks to add a PAK
upgrade to your ST (my be some kernel issues with PAK, not
sure about this).

I think (this is where I may be wrong) a port to the 68000
is currently being worked on but I don't know if it is available
yet so you may have to wait a while if you have your heart
set on using GNU C/C++

Regards,

What is your objection? No-one if forcing you to be moderator for the
new group.

>These days it is _much_ better to upload software to a web or ftp
>site and post an _announcement_ on one of the news groups!

Rather the reverse - a heavily overloaded binaries group would be
better forced onto ftp sites to reduce bandwidth.

>Really, such a group is just a waste of the little bandwidth it
>produces, and the space in people's .newsrc files!

Above.

>I sincerely hope that people that have a memory that goes back further
>than 6 months will vote NO on this RFD.

Mine does ...

I posted numerous times here and in the removed groups asking how it
was done. Never got a single reply.

In the "discussion" for its removal, I suggested you simply find
another moderator. This was ignored.

When the "discussion" was over, I voted against its removal, again
suggesting the above, or in view of the light traffic, that moderation
could be removed all together. Ignored again.

I saw 2 posts against its removal and 3 for. Nobody had a clue what
was going on and ignored the thread. Perhaps you got many more but you
did not summarise.

People need to be seeing software!

On a plain ST/STe set up a Minix partition (>=24Mb) under Mint
with Unix tools.

Try the german ftp sites for KGMD and umich & mirrors for GCC

There is at least GCC for MiNT. MiNT should be the standard OS for the Atari at the moment (every MagiC user trying to knock me down... MiNT is at least closer to Possix than MagiC, and Possix is still the only OS Standard availble).

It shurely can be used by any Processor. The 68K part of GCC makes 68000 code by default. In addition tis this almost every Processor up to the 040er is supportet directly via a command line Option.

I'm not shure if there is a up to date GCC version for single TOS as well.

Christof

Umich and other mirrors have MiNT, which is similar to Linux. That should do it well for you. I've been in contact with Evan Langlois about this. It'll do well for you. The Linux stuff requires the 030. I'd suggest you read up more on this. If you run onto my homepage, I have a link that allows you to go to more links, including those for MiNT and GCC. I'd suggest you have at least a meg of memory for MiNT, and a hard drive.

You may also want to look around for other compiler packages if you don't want GCC. There's the current Lattice C 5.6 currently selling at Toad Software. Older packages, if you can find them, like Mark Williams C, Megamax's Laser C, Prospero C, and others, can be found. If you do get these older packages, you must remember that the companies that developed them may not be in business any more. Mark Williams Company that made Mark Williams C is one. Prospero is still in business, from what I've seen.

Actually, you can use it without MiNT or Linux. That means you'd have to run everything in the same directory, which can give you a rather messy folder if you don't clean up every now and then.

Anyone know what happened to Brian Hauer of TSO Software's homepage? He's written that freeware BBS program that for some strange reason I keep forgetting the name. I try to get on, but all my connections time out or something. What's up?

Nope. You must do it yourself but you can get it to tell you which

register variables haven't been assigned. Without inspecting the code, user defined register variable usage can be rather dubious in any case.

G++ has been available for the Atari ST for as long as I can remember.

I believe the latest non-MiNT port is 2.5.8, which is relatively new.

I use 2.5.8 myself (only the C part, though) since I've not managed to
get the MiNT versions to run together with Outside on my Falcon.
(GAS seems to be the major problem for some strange reason.)

I built a cross-compiler from the 2.7.2 sources last week to see if
there were any differences, but I couldn't find any at all with my
(rather simple) test programs.

```

I must apologise for not making myself clear on this subject. Of *course* I didn't mean that it was impossible to do recursion without passing structures by value. C is a language in which you *can* do anything. The question is *should you*. All the early versions of C++ from Bell labs (Cfront?) were implemented as a preprocessor which output C for your local compiler using C as a kind of macro-assembler. That doesn't mean you can write object-oriented software in C. (I know, I've tried).

Using memcpy() as in your example *works* but is horribly inefficient and no use for production code. I must digress here on just how *awful* memcpy is because I have seen so much bad code written using it. memcpy is *not* a panacea for problems in program design - the function is a last resort *unaligned* *bytewise* memory copy function for kluges, hacks and copying buffers. It does unaligned bytewise memory copies. The code that MWC (or any compiler) generates for pasing structures by value is *inline* and quite well optimised. (Yes - the base addresses of structures are word-aligned - unless you start mucking about with them (well maybe some implementations aren't - but only if you set the size before speed flags on a non-RISC processor) and then you start using memcpy) 4 bytes at a time (or more of course depending on the word size), then 2 and then the last odd byte. That is why if you cannot pass structures by value you have to go and design and code an alternative. An array big enough to hold one's maximum recursion depth being a typical solution.

I probably sound over-the-top about this but I spent 18 months working on real-time systems on VAXen which were being ported to OpenVMS on Alpha boxes and the amount of dross code which used memcpy written by people who assumed it was somehow *magical*....On VAXen unaligned accesses are legal (but still cause a memory cycle penalty) - on Alphas they cause an exception and the OpenVMS emulation slopes off into software to do the copy for you (at a horrible performance penalty)...

Unaligned? Once people start (mis)using memcpy they start to do wonderful things like stuff (unaligned) malloced memory full of bits of arrays of structures...

At this point in my diatribe I must break off and point out that Guy Harrison is not guilty of any of these heinous sins, he just set me off....

The point being that memcpy is guaranteed to copy the memory for you ok, but it is slooooooow.

> >Of course nowadays passing lots of data on the stack is a *bad idea*.

Actually the point was more about register allocation and optimisers,
probably.

Which must have caused no end of fun when they got a new ANSI
compiler.....

Just installed MiNT tonight, and checked on gcc. All I need is a reference card of all the commands that gcc reads and uses. Haven't found one yet, unless I'm looking in the wrong place.

: I'm not shure if there is a up to date GCC version for single TOS as
: well.

There's 2.58 and 2.61 out right now. The version of MiNT I installed was .95, so I'll be updating it to 1.41, and so on. It's pretty nice, but I only need the command reference for gcc. Someone said I should look inside the source archive of gcc.

Hi Peter,

There are actually a lot of atari enthusiasts in Calgary. The city used to support four or five dealers, now sadly there are none. There are two users groups, Calgary Atari Computer Enthusiasts (CACE) and the Calgary Atari users group (CAUG). Both groups have BBS CACE at 2795375 and CAUG at 720-2286. CACE meets on the first and third mondays of the month and CAUG on the 2 and fourth wedensdays.

Your best bet for hardware and software is computer direct in Edmonton. Although most of the locals get by dealing with TOAD. It is really too bad that the there are no dealers surviving in the calgary area.

I am the liason person for CACE and I can be reached at 271-1481.
(sometimes - when my wife doesn't have the falcon hooked to the net).

BTW if there are any other calgaryor area people lurking out there we would love to hear from you.

I have been asked to write a programming column for the local user group disc magazine, focusing on C.

The person who asked for it has Sozobon C, but I have Lattice 5.6.

Questions:

1) What is Sozobon C? PD/Shareware?

2) What sort of compiler is Sozobon - ANSI, K&R or ???

3) Assuming PD/Shareware, where can I locate Sozobon? How large is it (I must pay for my data transferred over the net)?

4) What are the major differences between Lattice and Sozobon? Can I take a Lattice source file and compile it unchanged?

5) Anything I should know about Sozobon before I start?

Firstly, who is included in "colletively?" I opposed the
removal, and and I think most of the netizens of
comp.sys.atari.st simply didn't know what was happening.

Secondly, the lack of postings was apparently a problem with your
email inbox, as I sent several items to you for posting during
the last months the group existed; they were neither psoted nor
acknowledged, leading me to believe that they had been rejected
without comment. If you didn't get them, it might explain why
the traffic was so low.

>These days it is _much_ better to upload software to a web or
>ftp site and post an _announcement_ on one of the news groups!

There are still many Atari users who don't have ftp access.
While archiving files is always a good idea, it is not (IMHO) the
best way to ensure wide dissemination on a rapid time scale, nor
does it ensure that the file will even be made available at the
ftp site. For example, during the past two months, I have
submitted two original packages to at least 6 different ftp
archives, including umich. So far as I have been able to
determine, the packages are now available ONLY at cnam; they have
been ignored or consigned to Coventry at all the other archives.
And, since I fix bugs and upgrade my packages continuously, even
the one at cnam is now quite out-of-date.

>Really, such a group is just a waste of the little bandwidth it
>produces, and the space in people's .newsrc files!

Considering the amount of spam arising from the thousands of
clueless commercial phone sex adverisers and the clueless "make
money fast" chain letter posters, the amount of bandwidth we are
discussing here is trivial. In addition, I take issue with the
concept that it would be "wasted."
alt.barney.dinosaur.die.die.die is a COMPLETE waste of bandwidth,
yet it's on the backbone. The several hundred users of Atari
compatibles world-wide who would benefit from a moderated
binaries group certainly don't consider their systems to be a
"waste."

>I sincerely hope that people that have a memory that goes back
>further than 6 months will vote NO on this RFD.

In all honesty, I would expect to see an RFD to remove ALL
existing Big 8 binaries groups to appear from you within a week
or so, unless you simply have an ax to grind and are opposing the
Atari binaries group out of some sort of spite.

I sincerely hope that people who have any sense of fair play and
the ability to distinguish between new software and stale, old
software, would vote YES on this RFD.

>SikoKat@ix.netcom.com

I agree, Rich; WAV files are not only too big for current technology, and of relatively poor quality, there's a version that has recently appeared that works properly only under WIN95 (no idea what Microslop has done to it, but there you are). MP2 files are smaller, higher quality, and the standard is not subject to the whims of some marketing director in Redmond. <G>

So, I'm adding my favorite group of programmers to the distribution list on this followup, in hopes that someone will compile an MP2 player that works on a bog-standard 1040ST (and auto-detects STe/TT/Falcon audio hardware and uses it, if found).

Anyone?

If I were to write C code that had to exist on more than
implementation and maintain it, I would seriously consider doing it
without any standard library functions at all, except possibly stdio.
This does not mean that the likes of strcpy() etc would not exist,
just that the source for them would exist as part of the program.

>Using memcpy() as in your example *works* but is horribly inefficient
>and no use for production code.

I agree, up to a point. I have no problems writing inefficient code if
it is clearer and does the job acceptably. If it doesn't do the job
then I do something about it.

>I must digress here on just how *awful* memcpy is because I have seen
>so much bad code written using it. memcpy is *not* a panacea for

>problems in program design - the function is a last resort *unaligned*
>*bytewise* memory copy function for kluges, hacks and copying

>An array big enough to hold one's maximum recursion depth being a
>typical solution.

Another problem with manual optimization is this sort of nonsense ...

```
strdup(s)
char s[];
{register char    *p   =malloc(strlen(s) + 1);

 return p ? strcpy(p,s) : NULL;
}
```

.. leaving "register" out all together will more likely generate
better code - a decent compiler will ignore it, a not so good one will
waste time saving and restoring the register variable before issuing
the function calls - MWC will do this.

A better solution would be to duplicate the internals of strcpy() and
strlen() within strdup(), but even this could end up worse if, for
instance, the system strcpy() used a machine code string copy
instruction. With the sources incorporated into the program the
preprocessor can select the optimal choices.

>I probably sound over-the-top about this but I spent 18 months working
>on real-time systems on VAXen which were being ported to OpenVMS on

not to mention replacing string functions with mem functions as well!

>At this point in my diatribe I must break off and point out that Guy
>Harrison is not guilty of any of these heinous sins, he just set me
>off....

hehe, I certainly did! <G>

>The point being that memcpy is guaranteed to copy the memory for you ok,
>but it is slooooooow.

There is another, perhaps more important issue here - that of
understanding. Not many other languages give such low level access to
the system so easily and it is easily abused, not imo on purpose, but
through lack of understanding.

I gave up arguing in comp.lang.c about the "rewrite rule". I
consistently failed to get across the idea that a[] and *a are both
pointers, just one level of indirection between them. Not true, I was
told, a[] is an array, *a is a pointer, and an array isn't a pointer!

 g>
 g> People need to be seeing software!

I got some email from Annius today at work indicating that he did get my submissions, and that he thinks he replied that they would not be posted /becasue/ the group was going to be closed. I'm afraid I may have made (yet another) net.enemy here, but that's just too damn bad. My feeling is that Annius should, rather than closing the group in a "star chamber" action (whihc is what it amounts to when you tell people that you're about to do something, and give them insufficient information to support your opposition), have sought a new moderator.

I also dislike his attitude about software piracy intensely. In fact, I would go so far as to say it absolutely sucks. But that's personal and not germaine to this discussion. ;^/

K&R I'm afraid...

>3) Assuming PD/Shareware, where can I locate Sozobon? How large is it (I
>must pay for my data transferred over the net)?

I'd get it from HENSA (ftp micros.hensa.ac.uk)
There's also a debugger available, and a package called Heat'n'Serve Sozobon, which is a tad easier to set up. Might even come with a graphical shell. It's also at the UMICH archive. It's not too big.

>4) What are the major differences between Lattice and Sozobon? Can I take
>a Lattice source file and compile it unchanged?

Never tried. Well, I'm sure generic stuff should port. Sozobon does come with GEM and VDI libs, I don't know how they'd compare with Lattice. ('Cos I've never used them, I use Lattice..)

>5) Anything I should know about Sozobon before I start?

Might be the best bet for the newcomer. You've got a fighting chance of using it with a couple of drives and one meg. Most other P.D. compilers are a bit long in the tooth, and GCC's enormous. ST Format used it for a C tutorial a while back...

Have Fun,
"Augeas"

Commands?
Do you mean command line parameters?

There are _lots_ of parameters you can give to GCC, but most have little
real use. The most common are:

```
-o filename    Specify name of the created executable
-c             Don't link, just compile to *.o
-O             Optimize (you want to use at least this)
-O2            Optimize well (often creates much better code)
-S             Don't assemble, leave compiled code as *.s
-mshort        Use 16 bit integers
-m68000        Don't create >68000 code
-I path        Look for header files under path
-l lib         Link with the library lib
```

A simple build of a multi-file program could be:

Compile all the files (to *.o)

```
  gcc -mshort -m68000 -O2 -c *.c
```

Link the program

```
  gcc -o myprog.prg -mshort -m68000 *.o -lgem16
```

If you mean keywords, they are the same as for any C compiler, even if
GCC does have a few features of its own.

If you mean library functions, that depends on what libraries you have
of course. The standard GNU libraries can be used like any standard
ANSI C libraries.

 d> I thought Atari went out of business!

That's incorrect, and irrelevant to the discussion at hand anyway.

(1) Atari (the computer company) purchased a controlling interest in JTS
technologies (the hard drive company) and merged, adopting the new name and
abandoning "Atari" as a brand name.

(2) Atari computers and clones thereof are still manufactured by at least three firms; C-Lab makes the Atari/C-Lab Falcon, and the Hades and Medusa workstations also run TOS (the OS-in-ROM that is the basis for Atari computers).

And, assuming that there was no one still making Atari systems, there are still hundreds of thousands of Atari computers in existence and functional. The users of these systems are no less entitled to access the Interent than any other group.

You are thinking of a progdef, or userdef object. For these, you supply
the redraw function yourself.

The "extended type" and "extended flags" however can be set on any object,
progdef or not. It is up to you what you do with them since they are not
used by GEM. You should be careful however, future AES versions may use
them, and som replacement AESs such as Geneva use some of them now.

Luke Drelick (duky@worldnet.att.net) wrote:
: I thought Atari went out of business!
Your point?

Just because Amiga went out of business doesn't mean that there isn't
heaps of Amiga owners left surfing the net. The same applies to Atari,
who has merged with JTS, but I haven't seen anything official saying that
Atari is out of business.

Luke Drelick (duky@worldnet.att.net) wrote:

: I thought Atari went out of business!

Yes and no. Just because Atari went gone, or not, doesn't necessarily mean
that we don't get any more support from anyone. The old 8bit systems no
longer had support at all from Atari, but there is still support for it
via user groups and then some. Same with the ST systems and so on. Look at
the Commodore systems, the TI systems, and so on. Who gives it the most
support right now? The users. Don't knock them til you've tried it.

I'm not about to start a "my computer is better than yours" war, neither
do I want to see one. I'm painfully aware of a certain subject title like
this back in the mid-80s when it nearly killed the backbones of the other
systems on the network.. I see it nearly all the time here, with those

clueless idiots who don't even know where the message is going, much less
how to post a good message.

In essence, Atari is still around, alive and well, in our hearts.

I've been around here a long time and I can assure you that the old
binaries group went almost without postings for years.
Back in '88 there was some activity, but even then it wasn't much.

I don't remeber if I voted when the group removal was suggested, but if
I had, I would most definitely have voted YES.

Why, you ask?

1. Everybody with email has ftp access.
2. Everything that gets put on a binary newsgroup has to be archived
   somewhere (read ftp site) as well or it'll be gone in a week or two.

>: These days it is _much_ better to upload software to a web or ftp
>: site and post an _announcement_ on one of the news groups!
>But it is not free, why should IBM users get all the free bandwidth they
>want and Atari users with none?

Uhm, in what way is ftp access less free than Usenet newsgroup access?

Usenet news distribution is _very_ far from free, while ftp only takes
net bandwidth for actual accesses.

The huge number of IBM users makes distribution via Usenet a lot more
defensible. It might even save bandwidth if a large enough number of
people want the files. That'll never be the case for Atari users.

>: Really, such a group is just a waste of the little bandwidth it
>Well if it produces little bandwidth then what's the problem?

Why don't we create 20 new Atari newsgroups?

I must admit I don't see what kind of recursive algorithms you're
implementing. If the structure by value mechanism had been able to pass
entire trees or arrays I would (for some cases), but...

Of course there must be algorithms where it's useful, but I question
how common they are.

It is of course possible to do that, but it sure won't look very pretty.
In my main project, more and more things are getting 'pseudo-objectized',
but only on a small scale, naturally.

>Using memcpy() as in your example *works* but is horribly inefficient
>and no use for production code. I must digress here on just how *awful*

>hacks and copying buffers. It does unaligned bytewise memory copies. The

You're quite mistaken here, actually.

The code for memcopy() is very likely to be optimized for all kinds of copying. It will of course do bytewise copying when necessary, but it should also do whatever it can to make nice aligned copies _fast_.

Writing your own code instead of using memcopy is generally a _bad_ idea.

Still, if you do indeed want to pass structures by value, it's of course best to let the compiler decide what to do. I tested GCC on this earlier today and it will push the structure onto the stack using individual instructions, if it's small enough. When the size reaches around 50 bytes, GCC will call memcpy().

The tradeoff is of course the extra checks that memcpy() needs to do.

>size), then 2 and then the last odd byte. That is why if you cannot pass
>structures by value you have to go and design and code an alternative.
>An array big enough to hold one's maximum recursion depth being a
>typical solution.

OK, here we go:
What kind of recursive algorithms are you implementing?

I've written a quite a lot of recursive code, most recently a compiler for a functional language, and I can't recall having to copy structures at any time.

As an example, take recursion over a tree structure:
If you want to look at data anywhere, pointers work as well as copying.
If you have to update the tree, you're very likely better off with pointers, since you then don't have to replace any nodes when the lower recursion levels return.

For things like recursive sorts, C still can't copy arrays as parameters, unless they're part of a structure. Always passing the complete structures even when you've split the arrays is hardly a good idea, though.

>Alpha boxes and the amount of dross code which used memcpy written by
>people who assumed it was somehow *magical*....On VAXen unaligned

You'd normally be well advised to indeed treat memcpy() as magical. ;-)
It very likely uses assembler tricks that are better than what you could do with C. Still, when the compiler is free to chose, such as with the structure parameters, it's of course better to let it.

>accesses are legal (but still cause a memory cycle penalty) - on Alphas
>they cause an exception and the OpenVMS emulation slopes off into
>software to do the copy for you (at a horrible performance penalty)...

Without ever programming on an Alpha I can absolutely guarantee that

Digital's memcpy() doesn't use byte copies unless it absolutely has to.

>The point being that memcpy is guaranteed to copy the memory for you ok,
>but it is slooooooow.

No, it shouldn't be and in almost all cases is not.

Allow me to quote from the manual pages on this SPARCstation, regarding
the memXXX family of instructions:

> These functions operate as efficiently as possible on memory areas (arrays of bytes bounded by a count, not terminated by a null character). They do not check for the overflow of any receiving memory area.

That does _not_ mean that memcpy() is slow!

A strcpy() normally does _not_ copy a byte at a time either.
There are ways to check for the final '\0' without ever looking at
individual bytes.

There's no point trying to argue with those guys. They can quote the
complete ANSI standard at you without breaking into a sweat it appears.

While this can be annoying, it also means that they normally do know
exactly what they're talking about. If they say an array is not a
pointer, you can be certain that it says so somewhere in the standard.

While arrays and pointers are very closely related, it's not difficult
to come up with differences between 'ordinary' pointers and arrays:

 An array 'pointer' 'knows' a bit (only while compiling, though) about
  the area it points to when it's declared as multi-dimensional.

Excluding arrays declared as function arguments:

 An array 'pointer' is always constant.
 You can never have a NULL array.

<snip>

Yeah right. Sure it is. You just keep telling yourself that, buddy.

Look at the medium level computers (say a good 486 without an FPU, or mac
with a 68LC040 chip - the one without the fpu inbuilt to it)

If you ain't got an FPU, MPEG layer compression on Audio is close enough
to excruciating in the pain stakes...

It only took eight hours to decode an 80kb .mp2 file... came out as about
500 odd K of .aiff, but it came out... eventually.... now, if I only had
the years it would take to decode this 838K file.... or another computer
to sit there and decode for days (to produce a single sound?)...

Personally I believe that it would take me a lot less time to download a
28 meg wav version of a file than it would to decode a 100kb .mp2.

Hey, this computer is still fast, just not on floating point. Should see
the games rock on this computer, it processes fast, it compiles in a
flash... just without an FPU, you can forget about any kind of heavy duty
audio decoding like that.

And the same goes for RA2/3.

Anyway, .wav files are at least a standard quality. If you believe that
you can get 44khz/16bit quality output from a file compressed (with a
lossy compression system) at 10:1, you've got rocks in your head.

I know. :-(

>While this can be annoying, it also means that they normally do know

In terms of C, yes. However, they would not concede that in terms of
the generated code, at which point we are talking on the assembler
level, that both are pointers.

>While arrays and pointers are very closely related, it's not difficult
>to come up with differences between 'ordinary' pointers and arrays:

>
> An array 'pointer' is always constant.
> You can never have a NULL array.

True. An array must always exist (even if it somehow happens to be complete garbage), a pointer may not.

On seconds thoughts, better terminology ...

C always considers an array as valid, whereas a pointer may or may not be valid.

The above statement, if taken literally, can be argued to fall over on ...

```
foo(s)
char s[];
{
}

main()
{char    *p;

 p = malloc(...)
 foo(p);
}
```

.. as s[] can be NULL.

My point in the original discussion was that people learning C should take less effort to learn terminology and more on what is being hidden underneath. I failed dismally!

What is a pointer at assembler level ? Do you mean they are both
stored just in address registers ?

I think the difference between arrays and pointers is usually down to
the assembler level. With an array the base address of the array is
stored with a data register being used to index the element.

if an array is declared as 'short Array[5];' the code to address
element 3 would be something like...

```
lea          Array,a0                ; Array address
move     element,d0           ; Get element index
add        d0,d0                      ; word offset
move    0(a0, d0.w),d0      ; read element.
```

Admittedly, Array is a pointer, but it is a pointer to a list of
contiguous elements of a constant size. Whereas a 'pointer' is simply
the address of a single element.

All true.

> foo(p);
>}
```

Most modern compilers (by which I mean compilers that handle C++ and
C in the same package....) would not allow the above code, or would
at least give you warnings about types and parameters for this very
reason.

foo(char s[]) could arguably be declared as foo(char const *s)
since s is not allowed to change and any attempt to change it's value
should result in an error.

foo(char s[]) should NOT be synonymous with foo(char *s) which is
what your main() is passing, since char *s and char const *s are very
different.

I would expect most compilers to give you parameter / prototyping
errors/warnings when the above code is compiled.

Steve.

Yes, but see below.

That's more or less all I was trying to say in comp.lang.c! I was
actually trying to say that the difference is only in indirection -
that is with Array[], you have the address directly, with *Array you
have to go via another address to get Array[], twice with **Array and
so on.

>>>While arrays and pointers are very closely related, it's not difficult

```

That is sensible. My example was using K&R which has no such problem with the above code, remaining completely silent on the matter.

```
>foo( char s[] ) could arguably be declared as foo( char const *s )
>since s is not allowed to change and any attempt to change it's value
>should result in an error.
```

```
>foo( char s[] ) should NOT be synonymous with foo( char *s ) which is
>what your main() is passing, since char *s and char const *s are very
>different.
```

Strangely enough, I put this to use in K&R. If my function is declared foo(char s[]) then I use that to mean foo() does not alter s, whereas if foo() is to alter s then I use foo(char *s).

```
>I would expect most compilers to give you parameter / prototyping
>errors/warnings when the above code is compiled.
```

It's been a long while since I used an ansi compiler. I'll have to take your word on that. :-)

: Great - well, anyone with any or all of: some issues, a scanner, or
: knowledge of HTML is invited to help. :)

I have a whole pile of STart magazines, from the first issue on, and
access to a color scanner at school. I can look into obtaining some sort
of OCR scanner as well...

Have you considered including Analog and the various newsprint and
electronic magazines on your site? You could dub yours as the "complete"
Atari magazine archive. :)

We finally got another shipment of MFM hard drives so we have a ton of these and now there cheap!!! Only $10 each at this price they go fast!!!!! We also sell MFM controllers at only $5.50. Hurry up and send me an order if you wand these because these will be sold out soon and we might not get any more.

I'm fed up with MiNTOS. I'm having way too much trouble with installing and running it on my Falcon (4/85 & 530/4.04) and I want to switch my multi-tasking efforts over to Linux. Does anyone know how I can attain Linux? I've seen the CD-ROM, but, alas, I haven't a drive. I need to know where to get the files, how to uncompress them and how to set up the software on my hard drive (how much free space for Linux/X/etc.). I want to use X and the Chimera Web Browser so I may begin developing for them...

I'm sorry I missed the original post, but perhaps I have something to
offer. If I read this right, someone's thinking about puting the old
Atari mags on the Web? If so, I have access to a potential gold mine.

My father has all of the STart magazines (with the exception of two early
ones: issues one and three, I think) and a whole box of the old Antic
mags, including all the ones that contained the Atari ST section
(precursor to STart). The disks for all the STart mags are still in a
disk case, and most should work, so it might even be possible to put those
old programs on the Web. It might not be entirely legal, but who's to
argue? It'd be a shame for all of that excellent software to disappear.

You would, of course, have to be judiscious in putting former commercial titles up. Anyway, STart never really owned all of those programs. I know for a fact that they never payed for the programs published in the last half-dozen or more issues of STart; they still owe me a couple hundred dollars.

If the person who's doing this project would like these magazines and disks, I'm sure my dad wouldn't mind unloading them.

Regards,

Tom

Hi,

 I "inherited" a mint condition 1040ST color system. I can't
do anything with it except thinking of using it as a game machine.
Would someone kindly tell me some hot FTP sites that have Atari
ST sharewares and games?

Many thanks.

Please respond via. email.

Hello!

very sorry to bother you. I was wondering if someone could point me
towards some good NET references on how to program on ther Atari
8-bit computer. Be in in BASIC, or Macine, Game or utility I am
interested in learning how to code on the Atari, and the specifics
involved with it. I am currently knowelgable of 80x86 C, ASM and of
course basic. If someone could give me some starying
points/books/code I would be greatly appreciative. Thanks again.

>should not use Line-A, correct?

Yes, use either the VDI or AES - it doesn't really matter which,
except that you should try and keep to the same "level" as best you
can. Personally, I have always used the AES graf_mouse(). Vague
description ...

```
control  0   78
     1   1
     2   1
     3   1
     4   0

intin    0   mouse type index (mti)

mti  0   arrow
     1   vertical bar
     ..  (other shapes)
     7   outline crosshairs
     255 user defined (addrin[0] = 37 word array or NULL)
     256 turn mouse off
     257 turn mouse on

intout   0   0 on error, else no error.
```

>PS. If there's anyone else out there programming GEM in assembler, it would
>be nice to get in contact. DS.

I use C myself but I'm sure there are one or two other people who
prefer assembler. :-)

>*.warez.* is 2 days!!!!!

OK, that's exactly 2 explicit replies. I am currently working with another person to get the proposal properly assembled; it will be announced in all of the comp.sys.atari* groups when the RFD (Request For Discussion) is posted, and again when the CFV (Call For Votes) comes around. You MUST subscribe to news.groups to particiapte in the discussions - something that was /not/ told us when the RFD to remove our previous binaries group was opened. This is a nuisance, but you'll only have to carry the group for a month or so, as a 21-day discussion period is required, and the CFV can take palce between 21 and 30 days after posting.

If anyone else has any comments, PLEASE make them now, either here or in email.

What's the URL?

I did get in touch with the Webmaster at http://www.filez.com, and he's adding
an "Atari" button to the search engine there. Very nice guy, I sent him the
most common file extensions for Atari archives, and Hallvard's list of Atari ftp
sites.

There are SIX disks with MWC 3.09.
I have sitting before me a red labeled disk "csd", disk 1 of 1.

Ah, right! No, I wanted the source for the command shell (I've now
discovered it was never made public). Other command shells can
redirect ok so the bug must be in MWC. Additionally, there is mention
of something wierd about file handles in the startup code source.
Perhaps this is more than a coincidence?

>: with appropriate formatting and filtering. Output should be via
>: fprintf(stdout,...). The redirection of the output is the

If you've got a working example of the TOS Fforce() and Fdup() code
that would be good - the simpler the better. Anything I write seems to
fail - this could be down the "wierdness" in the startup code
triggering something in somw way. Who knows!

>That's what I'm gonna use. I located some other sorting routines, all
>using qsort, including one that's a bubble sort. A friend of mine was
>talking about this sort of thing.

Someone did send me some source for shellsort() but since my HD got
wiped I can't find anything.

>: I wasn't too clear. When TOS creates a file (Fcreate()) the directory
>: entry is created immediately. Fwrite() can then write as much data as
>: it likes but unless Fclose() is called that data gets lost and the
>: file ends up as zero length (lots of floating clusters). As MSH ends
>: up leaving a zero length file then it almost certainly means that MSH

>: _something_.
>
>Guess someone made a nice-size programming mistake.

Have a look at crts0.s - they were obviously struggling with something
there. Lack of docs was probably the cause. It is just possible that
patching the MSH startup will fix it.

>Always include one close statement for every time you open, or check
>to see if it's already open before you issue the open command.

exit() will close open files for you, and iirc stdio files opened
locally should be closed when their scope ends but I would never rely
on the latter for obvious reasons. I prefer to close files myself in
any case.

>Then when you quit the program or system, you get bad clusters,

>nervous, says he'll format and reinstall. heh... Same thing can happen
>on any computer if you're not careful.

It's the faster way to implement a filing system. The other way would
be to force the disk to be updated for each cluster so if there was a
crash only the current uncompleted cluster might be lost. Naturally,
this would be very slow as no cacheing of any sort would be
permissable.

>: It is. I was showing it is still possible to upgrade MWC for new

I should have run it! [below]

>MWC has for some reason decided that 'array' is an array of pointers
>to longs, but it isn't. It's an array of arrays of long!
>(The C equivalent of a standard two dimensional array.)

It wasn't MWC. It was me being a complete idiot! ;-)

>It can't be legal to treat my definition/declaration of 'array' that
>way. It certainly won't work in this case.
>
>Are you sure you compiled the same program?

Nope, I changed the long's to ints and then because it refused to
assign "array" to a register, I tried forcing it with **a=array I
would imagine! I'm not sure exactly what I did 'cos I had been up for
over a day and deleted it as soon as I'd posted it, else we could all
see the gibberish I wrote. I do remember I didn't increase the stack
so that would have stuffed it in any case!

Let's try again ...

```
/* increase 2K stack a bit */
long _stksize =16386L;

#define ROWS 25
#define COLS 25

void main()
{register long array[ROWS][COLS];
 register long i, j, k;

 for(i = 0; i < ROWS * COLS; i++)
     *((long *)array + i) = 0
 ;

 k = COLS * ROWS;
 for(i = 0; i < ROWS; i++)
     for(j = 0; j < COLS; j++)
          array[i][j] += i * k
 ;
}
```

which produced ...

David, there is a whole world of 8-bit users and programmers out there; most of them are hanging out in comp.sys.atari.8bit, and I have a pointer to a couple of good 8-bt references at http://www.3rdplanet.com/~starship/atari.htm - you may have some problems getting in, US West (the local phone company) has major trunk line problems right now, and I don't know who owns the T-1 trunk to the Sprintlink backbone. If you can't get it today, keep trying - they promised to have it fixed before Tuesday (that's right, 5 days or more to fix major problems - that's why many people call them "US Worst").

Hmm, not much I can edit out of that. Oh, well.

If you use the service and like it, send 'em feedback. I think, like most
similar web sites, they are supported by advertising, so any feedback they get
will help them sell the site to more advertisers, allowing them to buy faster
servers and sell more ads... You know how it works. <G>

Didn't know that you wanted the replies yet! Just in case you do. I am
behind the proposal 100%. See you on news.groups for the discussion.

I just finished updating my Atari bookmarks page at
http://www.3rdplanet.com/~starship/atari.htm - the changes are mostly to make it
easier to get around on the pages, with some cosmetic mods and a bunch of new
links (including a new section, "References," for helping you find out how to do
STuff).

There are sections for both 8-bit and TOS-based systems. Pop in and take a
look sometime!

Evidently, either I write code that is very close to what the optimiser
thinks is "perfect" (chuckle), or else I write code that the optimiser
just wont even bother trying to unravel. Methinks it's the second.
(Obfuscation rules - OK!)

Perhaps your code is written in such a manner that the optimiser can apply
all it's bag of tricks to it. (Maybe you write code tuned to the tools you
use?)

> >Lattice is still better than Megamax C, although not as fast as Laser C
> >(both in compilation and code produced). But it beats Laser in being able

Maybe I just wrote code that Laser found easy to optimise in the parser or
the code generator phase.

I seem to recall it [Laser] was a 16-bit integer, software floating point
(which got linked in even if you didn't need it, slowing everything down
needlessly), and had all variables at absolute 32-bit addresses (which
makes it hard to run multiple instances of the same prog in RAM using the

same code segment, but different data segments for each instance)

Speed wise, a moderately graphic GEM app I wrote in 1989-91 using Megamax and then it's successor Laser C ran quite reasonably on the 1040 STFM and the Mega 4 ST that replaced it.

Laser C ran entirely in RAM, caching all files in its own RAM cache - RAM discs would slow it down.

Lattice, on the other hand, runs entirely from disc (the only exception being if the source file is open in one of the editor windows). A RAM disc would speed it up significantly.

Converting the code from Laser C's K&R syntax to the ANSI syntax when I upgraded to Lattice C in 1991 (v5.06.02) created a slower and, if I my memory serves, bulkier program. Although, some bugs in my code were squished by ANSIfying the source, the prog did no more than the previous incarnation, but ran slower.

Some more gripes I have with Lattice C:

Unrolling loops (a common first or second optimisation strategy used by most optimisers) is something Lattice C does not appear to do - even when the loop has little to do, and the index range is constant)

The supplied assembler, ASM, is hopeless when compared to Devpac 3.1 at generating Lattice C object files. One cannot unroll loops (using the REPT/ENDR combo). There are some IF/ENDC conditionals that are not as reliable as Devpac.

But, on the whole, I like it in spite of it's faults.

Guy Harrison (guy@swampdog.demon.co.uk) wrote:

: Ah, right! No, I wanted the source for the command shell (I've now
: discovered it was never made public). Other command shells can
: redirect ok so the bug must be in MWC. Additionally, there is mention
: of something wierd about file handles in the startup code source.
: Perhaps this is more than a coincidence?

I don't know... Good question. I'm not sure about the redirection thing
that you did that showed this stuff, unless I'm still confused here.
heh... Possible coincidence, I don't know. I wonder if they also found a
way to disassemble the TOS code?

: If you've got a working example of the TOS Fforce() and Fdup() code
: that would be good - the simpler the better. Anything I write seems to
: fail - this could be down the "wierdness" in the startup code
: triggering something in somw way. Who knows!

I have nothing on this yet. Probably is better to use the regular file
open/close routines.

: Someone did send me some source for shellsort() but since my HD got
: wiped I can't find anything.

Found something on one of the FTP sites out there, but nothing on
shellsort(). Lemme look at the files I found, and post what I found if it
includes shellsort(). Next message will include the bubblesort routine.

: Have a look at crts0.s - they were obviously struggling with something
: there. Lack of docs was probably the cause. It is just possible that
: patching the MSH startup will fix it.

Haven't looked at it yet. There's so many other things I'm doing now, that
I'll be looking at that later on. But of course, lack of docs can easily
be the cause, if Atari refused to provide them with what they needed.
Seems that was Atari's worst thing, forcing people to pay before they
revealed what they called proprietary secrets. Maybe some of those people
could finally bring out some of those things.

: exit() will close open files for you, and iirc stdio files opened
: locally should be closed when their scope ends but I would never rely
: on the latter for obvious reasons. I prefer to close files myself in
: any case.

As always, but there's always going to be some bug showing up that will
cause the program to open an already-opened file. The manual mentions this
as well, closing all files, flushes the buffers, and returns control to
the calling program. As usual, the Pexec() command pops up.

: It's the faster way to implement a filing system. The other way would

: be to force the disk to be updated for each cluster so if there was a
: crash only the current uncompleted cluster might be lost. Naturally,
: this would be very slow as no cacheing of any sort would be
: permissable.

Of course, a cache and be useful, but not when your system decides to take a nosedive and take all the cache contents with it. I tried using it on my system. Bad idea. It slowed it down so much, that a normal write took too long to do. Haven't used it since, neither on my STE, Mega4, or 486. Losing the current uncompleted cluster can make you lose more than your data, rather, make you have crosslinked clusters, bad data areas, etc. I've seen it once too often. Once on my 8bit after a rather huge download spanning a bit of time, and a couple hundred sectors, it puked. Took two hours to fix. Got it back. Heck, I remember losing a good file to error 164, the dreaded mislink error, which linked the sector to itself.

: >Go ahead and get it. If you can't find the file, I'll post it here for you
: >and all. It's a pretty short file.
:
: okay.

Better yet, I'll post it for all to read... As below...

:
: I'm sad to discover the MSH source is not available. :-(

Don't be yet. I'm not done by a long shot. There must have been some employees who took home the source code just before they left for the final time. Our diamond in the rough. Probably would be even better if I could actually find Bob Swartz. I got an address from the fellow who was the sysadmin, so I tried it, but still no answer. Probably got around 30-40 mails so far about all this.

In the next few days, I'll be posting a message to here, .8bit, and .st about the TurboBBS, QBBS, and Forem ST sources.

Just follow the threads here on this base. We've been talking about C programming on the STs as well as some older compilers.

Rich Tietjens has a good homepage to start you out with. It's http://www.3rdplanet.com/~starship/atari.htm. I've been there and it's a rather good webpage. Mine, well, it needs improvement, but I'll be putting more stuff on it about the Atari systems, though I've got a link to one of the largest lists of links, from a fellow in France or Finland.

Not sure if this helps, but...

Unlike the MS-DOS machines, the Atari is entirely graphic based. It doesn't have a memory location as requested, exactly. However, in the LineA variable table are a few that seem to resemble the ones you are looking for.

V_SAV_XY
-$14E to $14B (Decimal = -334 to -331)
The first word contains the horizontal position of the saved text cursor, while the second word contains its vertical position.

V_CUR_AD
-$022 to -$01F (Decimal = -034 to -031)
Current text cursor address

V_CUR_OF
-$01C to -$019 (Decimal = -030 to -029)
Byte Offset from screen base address to the top of the first text character

V_CUR_XY
-$01C to -$019 (Decimal = -028 to -025)
The character position of the text cursor. The first word contains the column number, while the second word contains the row number.

Also

DESTX
+$04C to +$04D (Decimal = +076 to +077)
Horizontal screen position where character will be printed.

DESTY
+$04E to +$04F (Decimal = +078 to +079)
Vertical screen position where character will be printed.

These are all Line A Variables. This information is from the Compute!'s Technical Reference Guide, Atari ST Volume 3 - TOS, by Sheldon Leemon.

You might also want to look at the Volume 1, which covered the VDI.

What were you trying to do?

I will be posting the sources for extended file selector in MWC, STe sound
hardware access in MWC, GEM application startup and shutdown (half way to a
GEM application shell) and probably some other bits and pieces in a few days.
I rescued the sources off my old hard drive (which my brother-in-law now owns
as part of his MIDI setup) today and ZIPped them onto 720K disks which I
thought STe/NeoDesk had formatted as 720K DOS compatible disks - but my Mac
doesn't think they are DOS disks! So I'll have to copy the files onto *REAL*
DOS 720K disks on a PC or ST (Tuesday at the earliest) and sort them out
before I can post them.

> have now.

Nah, its not ANSI - but it *is* more ANSI than a lot of other compilers
of
same vintage on SUN/VAX whatever. The main ommission (and the one that
makes
people think it isn't *at all*) is ANSI function prototyping (Most other
compiler vendors put that in first and left the *more important bits*
till
later.) _But_ it does push structures onto the stack instead of
requiring
pointers (they get copied up to a limit (some weird size limited by
PC-relative addressing.)) Which I always liked because (most (of (the
(algorithms) I) write) are) recursive. (Why work out how to do it
yourself
when recursion makes the computer do the job - that's what they're for!)

Good stuff here. There's something that brings up the file selector from

GEM without having to rely on programming it yourself.

Hmm... If your Mac has System 7.5 or better, it can read the DOS 1.44 disks with no trouble. You gotta thank your brother for not deleting the stuff from the hard drive, though! I do know the ST can read the DOS 720K disks, while a TT and Falcon will read 1.44 disks fine. I did a comparison of how the Falcon and IBM systems format their disks, and the Falcon gives you a few K more.

But of course, the computer is supposed to make the job easier for the programmer instead of harder. There's been mention of stacks and pointers together and separate in my manual, which I'm about done reading, and probably will read it again. Sometimes the thing that drives you nuts is how all the vendors consider certain things important, while others aren't. Thus, you get some code that works on one compiler, but on another, you need a little modification. Then you get those packages that are so good, that they create lazy programmers, that tend to forget how to do a certain thing.

However, when you go cross-platform, you need to come up with something that will work with little or no modification, yet readable and understandable to all, even the newbies. I come across stuff every now and then that's not even commented, and the only things you gotta work with, are the system output printfs and other things. If you can't figger that thing out, then compile and run, and hope it works.

(Dave asks for programming resources for A8.)
Dave. You gotta have mapping the Atari from Compute. You have
Atari BASIC. Read Bill Kendrick's Newbie FAQ on how to use
Atari BASIC. (Lon Poole's 'Your Atari Computer' is a great
book on it. There is much source code in magazines, assembler,
BASIC and ACTION! Get some old ANALOGs, full of source code.
(Antics too). Uhmm. What else. The Cleveland Freenet
has a reference area that is good for a lot of things, I would
not be surprised if there isn't reference materials there
for programming (sorry I don't know specifically.)
There's plenty of BASIC code in the umich archive, I bet.
And finally, I'll offer you to look at my considerable pd
library and you can pick BASIC programs you might want to
look at, much of my pd object files I don't have source
code for.

Julian Forsythe (clifton@southern.co.nz) wrote:
: Request: Please create alt.binaries.atari.st

Although it is not available everywhere, alt.binaries.atari already exists
expressly for the purposes you outlined in your post.
alt.binaries.atari.st is unlike to propogate anywhere that a.b.a doesn't,
and if the issue is 8-bit traffic in that newsgroup, the 8-bitters have
their own alt.binaries group already. I think we could probably reach
agreement with them not to post to each other's binaries groups. A more
useful effort would be to create an Atari binaries group in the comp
heirarchy, using a.b.a until said group can be created.
comp.binaries.atari (or comp.banries.atari.st and comp.binaries.atari.8 if
your prefer) would be accessible by more people.

Ok this is not a Question, but just to let peeps know what I am programming, well just one question? is anyone else making any games ?

Platformer,
8 way smooth scrolling (smoother than HERO)
Animated backgrounds,
2d, but walks behind most scenery effect,
FAST 8 pixels scrolling, (think of SONIC speed):)
Hidden rooms
Invisible Platforms
Enhanced sound if run on a STe
The largest single play area seen on an ATARI Platformer,
Works on *ALL* TOS versions, *NO* fixers needed,
Needs minimum of One meg and FM or STe
Falcon Version in production, currently working but this is proving
. difficult as I dont own a bloody Falcon<G>

This is aimed to be a *Fun* fast and enjoyable platformer, with a few difficulties, but not too many, the artwork is of the highest standard and beats any I have used to date,Not by me I must add as I can't draw to save my life:)

The game will be ready in time for release at the upcoming ATARI shows,
The game will be FREEWARE and no charges,donations or any monitory gains will be asked for,
For more information on STOSSER Softwares many FREEWARE titles, drop into my web page:)

So anyone else making games ??

Cheers.....!ynoT

Thanks for the info :-)
What I was trying to do was to home the cursor to the top left corner after clearing the screen. This is for a C++ text adventure game which I am writing. Minor thing but makes the display a bit nicer.

I was hoping to be able to trap the cursor and eventually write a little editor but it is (obviously) not as simple as I thought :-)

Cheers,

Davy

On ATARI there are a lot of programms, that can convert a lot of
image formats . So you have to look for a programm that can do this.
(GemView, CharlyImage,Graphtool,Papillon, and so on..)
The file_format, that is known by the most graphik programms on ATARI is
the *.(x)img format.
I hope this will help you

Just thought you might like to know! CSD was sold separately.
From the coupon in the back of my 3.09 manual:
MWC was $179.95
CSD was $69.95
Library source code was "Call"

The programmers of TOS spend a lot of effort to make it inefficient.
That's why it is so slow. And due to that it is a rather bad idea to
watch the TOS routines working to learn how it works.

> * there are so many successive operations putting the machine into

Not supposing, it *is* neccessary to be in Super mode while accessing the port. However, staying in Super mode until the access is finished should work. And AFAIK it is not neccessary to disable interupts either for proper port access.

> As I say, what I'd really like to do is to write to the port without

> be compromised. And so I'm settling for the centronics port).

Any RS232 port access is even easier. All timing is done by the hardware, so the only reason to switch off interupts is to be fast enough to catch arriving bytes in time if a high port speed has been chosen. If you do the receiving part as an interrupt routine triggered by the port, you don't even need to care about this.

Note that there are more than one port on other machines, and any program doing something with one port should be able to do it with any port. This involves a fair bit of programming, of course, unless you use a serial port library, like the DEVICE-LIB by Jan Kriesten.

Cheers Peter

Hi,

Can anyone point me in the direction for materials to program for the 2600? Everything from writing the code to burning the chips? Any help would be appreciated. Emal: <georgeb@metronet.com>

Thanks.

George Broussard

Does anyone have the source for NOS/POP3? I'd like to modify the following to improve unattended sessions:

1 - Automatically email me session reports as to success of:
Email drop
Email pickup
News drop
News pickup

2 - Tidy up news posting:
My provider only needs one group statement before posting, not the two that NOS sends.

3 - Exit on carrier loss. Nos seems to stay active on carrier loss ignoring all "ppp sl0 idle 60" settings.

ATB,
    Karl

Doesn't MWC automatically allocate variables to registers?

[Assembly code deleted]

That's a bit worse than what TurboC/PureC did, but as for them no
real optimization is being done at all.

>Is this 16 bit / 32 bit behaviour typical of the other compilers?

Take a look at the code they produced in the other thread.

Generally, unless you specify that you want code for an '020 or better,
all multiplications by non-constants will be done via library calls.
To do differently, the compilers would have to realize that the numbers
are guaranteed to be small.
TurboC/PureC did the index calculation via a direct 'muls' even for long
variables, but that's because they don't allow >16 bit indices...

The problem is very likely that you use 16 bit integers (don't you?).
I think most people do that on the Atari and that upsets Lattice's optimizer.

>Perhaps your code is written in such a manner that the optimiser can apply
>all it's bag of tricks to it. (Maybe you write code tuned to the tools you
>use?)

It does happen that I write some things in ways I know GCC will handle well,
but that usually means that some other compiler will do a lousy job.
With a good compiler you really shouldn't have to worry much about the way
you write the code. As you could see in my article in the other thread,
there's often no point in using temporary pointers/values or ++addressing.

>I seem to recall it [Laser] was a 16-bit integer, software floating point
>(which got linked in even if you didn't need it, slowing everything down
>needlessly), and had all variables at absolute 32-bit addresses (which

I guess you mean all _global_ variables or it wouldn't have been possible
to do recursion. GCC normally does the same, but there's a flag that I
can't recall to make it use base relative globals instead.
I never use that flag since it tends to cause slower code.

>makes it hard to run multiple instances of the same prog in RAM using the
>same code segment, but different data segments for each instance)

I know MiNT can take advantage of such code, but I've never written any
software for which it would've been useful.

>Lattice, on the other hand, runs entirely from disc (the only exception
>being if the source file is open in one of the editor windows). A RAM disc
>would speed it up significantly.

A cached harddisk should be about the same, but I've not found a cache
program I trust on my Falcon with Outside, unfortunately.

>Unrolling loops (a common first or second optimisation strategy used by
>most optimisers) is something Lattice C does not appear to do - even when
>the loop has little to do, and the index range is constant)

Even GCC won't do that unless you tell it to.

>But, on the whole, I like it in spite of it's faults.

I very seldom use Lattice C itself, but the manuals are almost always on
my desk. The last release of them is almost unreadable, though.
Someone must have set his word processor up incorrectly.

Please DON'T DO THIS! I was the last moderator for
comp.binaries.atari.st and it was collectively decided best to
discontinue the groups. We had at most one or two postings a month!
These days it is _much_ better to upload software to a web or ftp
site and post an _announcement_ on one of the news groups!

Really, such a group is just a waste of the little bandwidth it
produces, and the space in people's .newsrc files!

I sincerely hope that people that have a memory that goes back further
than 6 months will vote NO on this RFD.

I agree with you strongly on this point. However, it is completely
impossible to keep various users from posting binaries in the
newsgroups. If they will not do it the correct way, at least give
them a place that's more appropriate. As an analogy, if you have
a dog that refuses to releive itself outdoors, do you give it
a *more* acceptable place indoors, or just allow it to continue
shitting on the sofa? These people are going to defecate in our
newsgroups, so there may as well be a more appropriate place for
it.

> I sincerely hope that people that have a memory that goes back further
> than 6 months will vote NO on this RFD.

I've read the official line on this (that the group was dissolved by
mutual agreement between you and the readership) and I've heard
stories from the other side (that the users were by and large unaware
that the group was being dissolved). For some reason, dejanews is
missing this critical period in c.b.a.st, so I can't verify either
side's story; however, I warn everyone to take both sides' claims
with a grain of salt. (I'm a bit confused by the lack of any formality
in the dissolution of the group, though. I'm aware that no procedures
exist for deleting groups, but this seemed particularly unceremonious).

Could be that the reason for the one or two posts per month was that
every time I tried to post to that group, my post never appeared! I have
heard several other people here on c.s.a.s complaining of the same
experience! If you need to do something other than just post to the group
with PINE, then there should have been a FAQ telling us how to go about
posting to the group! This was the only moderated group that I
encountered on Usenet and still have no idea what is the proper procedure
for posting to such a group!

More so with multitasking. Even more reason to not leave files open
longer than necessary.

I get quite a few floating clusters under MagiC. Most of those are
down to my programs bombing when I'm testing them. Other than having
to run something to retrieve then once a month or so, I don't get any
serious disk problems any more.

Under K&R ...

```
typedef struct     {
int  fred,
     jim;
}    EG;

main()
{EG  wibble;

 op(wibble);
 op(&wibble);
}
```

are one and the same thing (pointer always passed), whereas ansi (thus
MWC also) passes a copy of the whole structure for the 1st and a
pointer for the 2nd.

If compiling K&R code you then need to replace all occurrences of
op(wibble) with op(&wibble). It will then compile correctly on both.

That's for you to decide. They are bits unused by Gem therefore you
can use them to represent anything you want. You might implement a
FLASHABLE object for instance!

I'm looking for fellow Atari users in the
great city of Calgary, Alberta.
Is there anyone out there? If there is,
please e-mail me!!!
I'm interested in finding out just how many
Atarians there are in Calgary, and finding out
about where I can get Atari hardware/software
in Calgary.

Besides, it would be nice to see that there
are still plenty of Atari supporters around,
especially in the city where I live.

Y'all come back now, y'hear?

Chow,

Sentinel

In general, if a moderated group has extremely low traffic (on the order of a message a year or so) and the moderator requests or agrees with the removal of the group, it will be removed. (This just recently happened with news.lists.ps-maps, for example.) Since all postings to the group have to be approved by the moderator anyway, if the moderator decides to stop approving articles the group is essentially dead. In that case, either a new moderator needs to be chosen or the group should be deleted.

I believe that the normal action for most moderated groups (news.lists.ps-maps was a special case) is to post a message to the group asking which option the readers want. I'm not familiar with the details of this particular situation.

Note followups.

As I understand it, (and I'm no GEM programmer--next project) from what I gather from the ProGEM series by Tim Oren, to use an extended object type, you have to supply a pointer to a routine which will handle the object type. GEM obviously doesn't know what to do with it, so you have to handle it yourself. There are libraries available that supply functions to handle snazzy stuff like pop-ups...

Just verify if _atof(and others) are in alphabetical order in libc.a.

Some linkers assume to work with sorted symbols, and have options to go over(?) 'lib' more than once.

Float in sozobon are in another lib, but I remember some limitations with printf and other(have a look in documentation).

With sozobon 2.0 I found a bug with optimizer(tops) with some functions. I removed some options of tops and could re-compile libc.a and used it. I don't know of next version.

I remember also an option speeding the link if you have enough
memory(I think more than 512K).

Please note they are old memory(5 years). So verify them.

```

Exactly - MWC isn't fully ANSI but it *does* pass structures by value (if you want it to) which makes a *huge* difference to the coding of recursive routines. I remember using the Sun workstation compiler around 1990 and although it had ANSI prototypes it didn't support structs by value (whereas MWC didn't have ANSI prototypes but *did* have structs by value.) A simple substitution would simply not work *at all* (obviously - *recursion*) - you have to go and build an auxiliary stack to keep the data structures on which uglifies a nice simple algorithm. Of course nowadays passing lots of data on the stack is a *bad idea*. I'll leave it to the language lawyers to comment on op(wibble) vs op(&wibble) under K&R but my recollection is that only the op(&wibble) version is legal K&R and op(wibble) could only work under K&R if the compiler silently (and erroneously) changed it for you... (lint, lint, lint).

Guy Harrison (guy@swampdog.demon.co.uk) wrote:

: I originally purchased 3.0.5 - there was no csd with it. MWC sent me
: 3.0.9 after I wrote pointing out a bug. If 3.0.9 came with csd on a

: disk of its own then I suppose I could have missed out on it, not
: having purchased 3.0.9 directly.

OK... I checked my end closely. Apparently, when you bought MWC, you got the software, thick manual, and Resource Editor manual. Seems my package had csd included, when the previous owner bought it separately. Someone says, thought it might have been you, that there's something comparable, the -VCSD switch. My Release Notes that came with the package I have mentions this. I quote from it; "Include csd debug information in the objects and executable." Sounds like you can use the debugger while in the cc program. There's also the db program, which is the assembler-level symbolic debugger.

: I did a tiny bit of investigating of the broken shell. The bug is
: always the same. Even a simple "ls > z" ...

How does this ls thing work? Do you have the unassembled code lying around? I'd like to see it.

: This appears to be down to Fforce() and Fdup(), although I'm not
: certain of that - I'd have to do some test code to refresh my memory.
: It might just have been MWC's dup() and dup2().

I keep forgetting... What does MSH stand for again? The Fforce and Fdup have something to do with file handles, which can easily have something to do with the infamous 40 folder bug. That's different than the dup and dup2, which have to do with file descriptors.

: MWC is easy enough to upgrade for newer OS functions, especially TOS
: ones. Gem ones are a little more longwinded but still easy.

Right. I've read through the manual about this, and the AES and GEM ones seem to be pretty easy, creating GEMboxes for alerts and so on. Haven't read up on the VDI one, as I'm on K right now, going through it page by page. Worth the time, though! I'm gonna need to look up more info in detail on GEMDOS, AES, and VDI programming, though someone mentioned some good places on the Web for them.

Also, there's going to be a new subject coming up about MWC emails. Don't let the subject confuse you. It's a message from me, that I've crossposted to here and comp.os.coherent, where some of the ex-employees of MWC lurk, from what others tell me. I'm hoping to get a good discussion going here, that's hopefully educational. Ye gods, the history I keep coming across! I've got a bit of folded paper that's rapidly filling up with writing from my searches out there.

I've located still more people who may help out in locating those who wrote Forem ST (that is, the people that Matt gave the source code to), TurboBBS, and QuickBBS. All this is netting me several emails a day, plus I'm sending out others, other than my normal replies.

MWC went out of business in early 1995, from the results of my intensive use of the various search engines out there. From what I've been told by various people, the ex-employees hang out here and mostly lurk.

I'm here for a few reasons. Mark Williams C was released for the Atari ST systems for a short time, then for the next several years, up to the passing of the company, Mark Williams Company was dormant. If someone can check, what was the last release of the Atari ST version of the Mark Williams C package? It's 3.0.9 from what I've heard. Is Bob Shwatz still around? How do I contact him? In my manual, there's an 800 number, 1-800-692-1700, that's still in use. I tried calling through a TTY relay service, since I'm deaf, but the person who answered was incredibly rude to the operator and I, refusing to even let us get in a word edgewise before unceremoniously hanging up on us, saying he had no time. Another fellow tried calling, but seems he had no better luck, with the guy on the other end sounding weird, and he was unable to understand much of the conversation. Now, who *IS* the present owner of this number?

Finally, this message is being posted to comp.sys.atari.programmer and comp.os.coherent, since the people in both groups will want to see the answers posted, as there's a discussion about this on the c.s.a.p group.

Sez who that a deaf person can't have fun on the net? No ears required!

The CDA was dishonorable. It was an honorable warrior who struck it down.

hi

Can anyone tell me a what addresses the ST keeps the x,y text location of the cursor??

I am trying to control the cursor from GNU C.

Thanks
Davy

Much the same as the unix ls command.

>Do you have the unassembled code lying around? I'd like to see it.

I'm afraid not, ls is wired into the MWC command shell. I'm sure you could get a good idea of its functions by looking at unix source.

MagiC does not suffer from the 40 folder bug. One thing I forgot to mention is that the shell gets as far as creating the redirected file. As it is zero length then the shell obviously packed up before it got to issuing an Fclose().

Here's a section showing how I added some newer Gem functions. Boring, but perfectly possible. It could be simplified further with the MWC library code sources because crystal() could be used I guess.

It is definitely 320 words per line in 320x200x16.

You may have by accident(!?) set the linedoubling bit, which also works in
RGB-mode and gives a resolution of 320x100 but it still looks like 200
lines.

Are you sure you don't move longword or something else which makes you
move twice as much??

Any help?? If not, it's quite a weird computer you have! :)

(snip snip snip)

Excellent! This will save on mailing and acquisition costs definitely!
Unfortunately I only have 2 or three issues left in my collection (they
went the way of my 800xl - disappeared under mysterious circumstances)
but this was one of the best, most focussed magazines ever. One thing
you might add is a link to the Antic disk archive at ftp.clark.net,
under /pub/atari/mag/antic/. Maybe you can even place a link to the
appropriate file in articles instead of giving the computer listing.
I just checked the archive and the files are under directories corres-
ponding to each issue, that is the disks are not just one zip'd blob
file each.

Oh, and can you post the permission letter to the newsgroup, and have
the info placed into the appropriate FAQs (especially newbie). That
may lessen the confusion later on and the charges of copywrite infringe-
ment from people who don't follow this thread.

I am happy to announce the launch of the Digital Antic Project. Antic

magazine was the premiere magazine devoted to 8-bit Atari computers. Antic, like the 8-bit Atari, has been forgotten by all but a small minority...

The Digital Antic Project is a small crusade to put all of the old issues of Antic (and eventually its sister magazine, STart) on the Internet. I have received permission from the publisher of Antic to make the material available on the Internet for free.

The site currently features the complete text of the first two issues, as well as cover art and memorable ads from the magazine. More material will be added as time permits -- faster if YOU volunteer to help by scanning, HTMLizing, or proofreading.

The site is at http://www.northcoast.com/savetz/antic/dap.html

Your comments, suggestions and help are welcome!

Current contents of the site include:

----- April 1982 - Vol.1 No. 1
Products in Depth - A survey of three word processors
Starting Line - Glossary for the novice
Systems Guide - Memory Map, part one

Is it Antic that had a way to improve the 800's video??
If so, please add this to the sight.
